Appendix2 City-Wide Annual Surface Water Quality Monitoring Report 2019
Appendix3 Stormwater Projects by SMP Area
Appendix4 Schedule 1 Sites Excluded from the Discharge Consent CRC190445
Appendix5 Industrial Site Audits 2019

# **1** Introduction

On 20 December 2019 the Environment Court issued a consent order for the Comprehensive Stormwater Network Discharge Consent (CSNDC) CRC190445 authorising the majority of stormwater discharges into surface water and onto land within the Christchurch City area and from the Council's reticulated stormwater system.

As part of the consent application process for the CSNDC CCC developed the "Environmental Monitoring Programme for the Comprehensive Stormwater Network Discharge Consent for Ōtautahi/Christchurch City and Te Pātaka o Rākaihautū/Banks Peninsula" that provides a holistic approach to monitoring the impacts of stormwater discharges on the environment and to assess compliance with the environmental objectives.

## 1.1 Background of the CSNDC Consent

Prior to the granting of the CSNDC consent, CCC held four primary resource consents. CRC090292, also known as the Interim Global Stormwater Consent (IGSC), which authorised all existing stormwater discharges within Christchurch City Council (CCC), excluding Banks Peninsula, except those authorised by the catchment specific consents. The IGSC was a short term consent that was intended to allow CCC to develop SMP's for the catchments within the Christchurch area. As SMP's were developed and resource consents granted by ECan the SMP areas were authorised by their own consents. The first of these was known as the South West Consent CRC120223. The second was known as the Styx Consent CRC131249. Once all SMP areas possessed individual consents the IGSC would no longer be required. The final of the four consents was an older consent authorising discharge to land CRC000315. Subsequent to the Styx Consent being granted a change in philosophy was agreed between CCC and ECan and resulted in CCC seeking the now granted CSNDC, one consent for all catchments.

### 1.2 Purpose of the Annual Report

Council is required by Condition 61 of the CSNDC to provide an annual report to Environment Canterbury, the Zone Committees and Mahaanui Kurataiao Limited by 30<sup>th</sup> June each year. The report must cover the previous Calendar year and be made available on the Council website. Given that CRC190445 was only issued on 20 December 2019 the wording of condition 61 suggest the first report is not required until 30 June 2021. However it seems more transparent to provide as much information as we have available and that is relevant from the 2019 year.

# 2 Developments authorised CRC190445

CCC has authorised stormwater discharges under consent CRC190445 since 20 December 2019 when the consent order was issued. This occurs when an applicant (e.g. developer, customer building a new residential dwelling) apply for a resource consent, building consent or subdivision consent and is required to ensure that the discharge of stormwater from the building or site is legally authorised. An applicant may then choose to request authorisation from CCC to discharge stormwater under consent CRC190445 or to obtain their own resource consent from ECan.

The authorisations given by CCC to applicants have been for sites including subdivisions, redevelopment of commercial and industrial sites, residential housing units, schools and individual house lots. Attached as Appendix 1 is a list of the 273 sites that have been authorised to discharge up to 31 May 2020 (required by Condition 61h.

ECan are notified of sites authorised to discharge under the consent on a monthly basis. CCC request advice from Environment Canterbury on applications for discharge approval which might be unacceptably high risk. In accordance with Condition 2(d), those sites Environment Canterbury advise should be considered unacceptably high risk consent are not provided Stormwater approval by Council. Rather their discharge is managed via resource consent with Environment Canterbury.

# **3 Implementation of Environmental Monitoring Programme**

CCC have undertaken environmental monitoring over the period of 1 January 2019 to 31 December 2019 in general accordance with the "Environmental Monitoring Programme for the Comprehensive Stormwater Network Discharge Consent for Ōtautahi/Christchurch City and Te Pātaka o Rākaihautū/Banks Peninsula". The results and assessments of the results are provided in this report (Appendix 2). Please note the version provided in this report is a Final Draft and is now subject to Environment Canterbury review.

# 4 Stormwater Projects by SMP Area

The milestone timetables as at 9 June 2020 for Council Stormwater mitigation systems are provided in Appendix 3.

# 5 Schedule 1

Schedule 1 as a concept originally began with the South West Catchment consent granted in 2012. The schedule is a list of properties deemed by Council to be too high risk for us to extend authorisation to these sites. Sites excluded under previous consents have been carried in the CSNDC and formed the original CSNDC schedule 1. Some additional sites have been excluded in recent months and the latest Schedule 1 of properties excluded from authorisation under CRC190445 is provided in Appendix 4.

# **6 Industrial Site Audit Programme**

The industrial site audit programme is intended to identify potential or actual sites or industrial activities that pose an unacceptable risk to the quality of stormwater discharge. The programme is anticipated to identify these sites and assist site owners and/or operators to identify on-site risks, onsite infrastructure and site management practices that could impact the quality of stormwater being discharged from their sites. Ultimately, it is anticipated that this will assist in improving the habitat of waterways which will reduce the impact on instream biota. In this regard there is a great deal of commonality between the proposed site audit programme and the Pollution Prevention Programme run by ECan. The purpose of both programmes is to improve stormwater discharges from individual sites, resolving problems at the source, therefore improving the overall stormwater quality which will reduce the impact on waterway health and instream biota.

In 2019 13 industrial site audits were undertaken however two site were allowed, by Environment Canterbury, to account for two audits due the size and completely of the sites and therefore scale of work involved in completing a thorough audit. Details of the audit sites can be found in Appendix 5

# 7 Discussion

The resource consent condition 61 of CRC190445 requiring an annual report appears to only require a report following the first full year after the consent commenced. However it seems sensible at this point to produce the relevant information we do have and share that with the necessary parties. To that end this annual report has been produced and is being circulated in line with the consent requirements.

<b>Table 2.</b> Parameters analysed in CCC monthly and wet weather water samples taken in accordance with consenting requirements
Table 3. Number of waterway sites monitored for each parameter (where guideline levels are available), the number of samples analysed and the number of samples and sites (based on medians/95 <sup>th</sup> percentiles, depending on the parameter) not meeting the guideline levels, during the monitoring period of January to December 2019.22
Table 4. Water Quality Index (WQI) scores at each site for the monitoring period of January to December 2019 and direction of significant trends ( $p \le 0.05$ ) since 2013. Additional water quality categories not represented by sites in 2019 are 'very poor' (0–39.99) and 'very good' ( $\ge$ 90)29
Table 5. Best and worst catchments and sites for the monitoring period January to December 2019, basedon the Water Quality Index (WQI). Red = $\bar{O}t\bar{a}karo/$ Avon River catchment, orange = $\bar{O}p\bar{a}waho/$ HeathcoteRiver catchment, blue = $P\bar{u}harakekenui/$ Styx River catchment, green = $\bar{O}t\bar{u}kaikino$ River catchment, andpurple = Huritini/ Halswell River catchment. Linwood Canal (WQI = 61) is not included as a catchment, asonly one site is monitored
Table i. Laboratory methods used over time to calculate parameter concentrations. N/A = Not Applicable.
Table i. Summary of the date of first monthly sampling at the 44 water quality monitoring sites. Dissolved         metals were monitored from 2011, unless otherwise specified
Table i. Direction of significant trends (p≤0.05) for parameters monitored monthly at each of the sites in the Ōtākaro/ Avon River catchment (refer to Appendix C, Table i for sample periods). Parameter changes represented by an arrow with no number are where a statistically significant change was recorded, but due to a high proportion of censored data, only the direction of change could be calculated
Table ii. Direction of significant trends ( $p \le 0.05$ ) for parameters monitored monthly at each of the sites in the $\bar{O}p\bar{a}$ waho/ Heathcote River catchment (refer to Appendix C, Table i for sample periods). Parameter changes represented by an arrow with no number are where a statistically significant change was recorded, but due to a high proportion of censored data, only the direction of change could be calculated.
Table iii. Direction of significant trends (p≤0.05) for parameters monitored monthly at each of the sites in the Huritini/ Halswell River catchment and Linwood Canal (refer to Appendix C, Table i for sample periods). Parameter changes represented by an arrow with no number are where a statistically significant change was recorded, but due to a high proportion of censored data, only the direction of change could be calculated
Table iv. Direction of significant trends (p≤0.05) for parameters monitored monthly at each of the sites in the Pūharakekenui/ Styx and Ōtūkaikino River catchments (refer to Appendix C, Table i for sample periods). Parameter changes represented by an arrow with no number are where a statistically significant change was recorded, but due to a high proportion of censored data, only the direction of change could be calculated
Table v. Direction of significant trends (p≤0.05) for parameters monitored by the Styx Living Laboratory Trust, with sufficient data to run Time Trends analysis74

# **Executive Summary**

- This report summarises the results of the Christchurch City Council (CCC) surface water quality monitoring for the period January to December 2019, in accordance with the CCC Interim Global Stormwater Consent, South-West Stormwater Management Plan and the Styx Stormwater Management Plan.
- Monthly water samples were collected from 42 sites within the five major river catchments of Christchurch City (the Ōtākaro/ Avon, Ōpāwaho/ Heathcote, Huritini/ Halswell, Pūharakekenui/ Styx and Ōtūkaikino Rivers) and Linwood Canal, as well as two sites within Halswell Retention Basin.
- Wet weather sampling was conducted at four of the eight monthly sampling sites in the Pūharakekenui/ Styx River catchment, and at seven of the thirteen monthly sampling sites in the Ōtākaro/ Avon River catchment. The Pūharakekenui/ Styx River sampling was due to be collected in 2018; however, unfavourable weather meant that only one suitable event occurred, and the final sample was not collected until 2019.
- Results of community monitoring at eleven sites in the Pūharakekenui/ Styx River catchment by the Styx Living Laboratory Trust are also presented in this report.
- The water quality parameters specifically assessed in this report for monthly samples include metals (copper, lead and zinc), pH, conductivity, total suspended solids (TSS), turbidity, dissolved oxygen, temperature, biochemical oxygen demand (BOD<sub>5</sub>), ammonia, nitrogen, phosphorus and *Escherichia coli* (as an indicator of pathogens).
- Over 11,000 tests were conducted for the monthly monitoring, with 7,440 of these allowing the assessment of each waterway site against relevant guideline levels. There were several parameters that were recorded at levels unlikely to cause adverse effects, including dissolved lead, total ammonia and pH. However, 20% of all samples did not meet the guideline level, with 98% of sites not meeting the guideline for at least one parameter. The contaminants of most concern were nitrogen, phosphorus, *E. coli*, dissolved zinc, and dissolved copper, as well as turbidity, dissolved oxygen, TSS and nitrate at certain sites. The concentrations of all parameters have mostly remained steady over time, with some improvements and declines in water quality.
- Most waterways recorded a Water Quality Index (WQI) of 'poor'. The Öpāwaho/ Heathcote catchment recorded the poorest water quality of all the catchments overall. Changes in catchment WQI between 2013 and 2018 were variable. The site with the lowest WQI was Curletts at Motorway, followed by Heathcote at Tunnel Rd site, and then the Haytons Stm and Heathcote at Ferrymead Bridge sites. The Ötūkaikino River catchment recorded the best WQI of all the catchments, and the site with the highest WQI was Styx at Main North Rd in the Pūharakekenui/ Styx River catchment.
- The results of this year's monitoring are largely consistent with those recorded in previous years, indicating that many of the waterways are historically and currently subjected to contamination, potentially from stormwater, waterfowl and other inputs. These contaminants may be causing short-term and long-term adverse effects on biota, proliferation of aquatic plants and/or algae, human health risks from contact recreation, and deterioration of the aesthetics of the water column.
- The sites and parameters of concern in this report should be the focus of improved catchment management practices in Christchurch. Recommendations are made in the report for priority areas of focus.

# 1 Introduction & Sampling Sites

This report summarises the results of the Christchurch City Council (CCC) surface water quality monitoring for the period January 2019 to December 2019. This monitoring is in accordance with the requirements of the Interim Global Stormwater Consent (IGSC; CRC090292; Dewson & Rodrigo 2009), South-West Stormwater Management Plan (SMP) (CRC120223; Golder Associates 2012) and Styx SMP (CRC131249; Golder Associates 2013).

Monthly water samples were collected by CCC from 42 waterway sites: 41 sites within the five major river catchments of Christchurch City (the Ōtākaro/ Avon, Ōpāwaho/ Heathcote, Huritini/ Halswell, Pūharakekenui/ Styx and Ōtūkaikino Rivers), and one site in Linwood Canal (Table 1, Figure 1). Although not waterway sites, two sites within the Halswell Retention Basin (inlet and outlet) were also sampled. Six of the waterway sites were specifically chosen because they are in proximity to stormwater outfalls<sup>1</sup>. However, it should be noted that there are hundreds of outfalls throughout the catchments and many of the other sites are also located near stormwater discharge pipes. There are five sites that are in strongly tidal areas, where sampling is undertaken at low tide  $(\pm 30 \text{ minutes})^2$ .

The results of community monitoring at 11 sites in the Pūharakekenui/ Styx River catchment by the Styx Living Laboratory Trust (SLLT)<sup>3</sup> are also presented in this report (Table 1). The Styx River catchment was due to be monitored during two wet weather occasions in 2018; however, a lack of suitable rain events meant that sampling extended into 2019. The Avon River catchment was monitored during two wet weather occasions in 2018; however, and the sampling extended during two wet weather occasions in 2019. The results of both wet weather monitoring rounds are presented in this report.

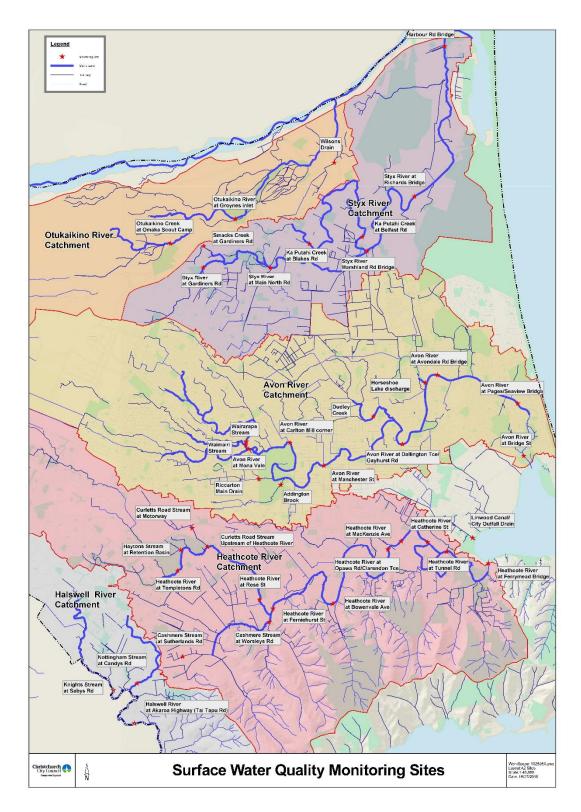

Figure 1. Location of Christchurch City Council surface water quality monitoring sites

# 2 Methods

### 2.1 Sample Collection and Testing

CCC monthly samples were collected predominantly via grab sampling, with field testing of temperature and oxygen using a hand-held meter (YSI Pro ODO meter). During the 2019 monitoring year, no monitoring was undertaken at the Haytons Stm site (March and June) as it was dry, and at the Kā Pūtahi at Blakes Rd (August) and Ōtūkaikino at Scout Camp (February) sites, as they could not be accessed.

SLLT volunteers have analysed water in the field for pH (Eutech pH pocket testers 30), conductivity (Eutech Cybernetics TDScan 3), water clarity (clarity tube) and water temperature (glass spirit thermometer) since 2004. Samples were aimed to be taken every third Saturday of the month, but as this was based on volunteer availability, the number of samples taken annually at each site ranged from 6 - 10. Of note:

- There was no data available for 2016
- 2015 and 2017 had a small number of recordings
- pH readings changed from using test strips to a handheld meter in February 2010; therefore, pH data prior to this time have been excluded from this report

The wet weather samples from the Pūharakekenui/ Styx River catchment were collected on the 3<sup>rd</sup> of September 2018 and 4<sup>th</sup> of September 2019. Total Petroleum Hydrocarbons (TPH) were unable to be analysed during the first event due to a sampling error. Wet weather samples collected from the Ōtākaro/ Avon River catchment were collected on the 18<sup>th</sup> of October and 17<sup>th</sup> of December 2019. Samples were collected via grab sampling, and field testing of temperature and oxygen using a hand-held meter (YSI Pro ODO meter). Wet weather events were required to meet the following criteria:

- Minimum of a three-day dry period prior to sampling<sup>11</sup>
- Minimum of 5 mm total rainfall depth<sup>12</sup>
- Catching of the "First Flush" (considered to be up to the first 15-25mm; Christchurch City Council, 2003), by sampling within 1 – 2 hours of the desired rainfall depth being achieved

The CCC monthly samples were analysed at the CCC International Accreditation New Zealand (IANZ) laboratory for the parameters outlined in Table 2 (except for those measured in the field). Not all parameters were tested at all sites, and only the most pertinent parameters (typically with guideline levels) are analysed and discussed in this report. The methods used to analyse each parameter, including laboratory Limits of Detection (LOD), are presented in Table i in Appendix A. Some of these methods have changed over time, as more advanced equipment has become available, and timeframes for changes are detailed in this table.

<sup>&</sup>lt;sup>11</sup> On advice from Dr Aisling O'Sullivan (University of Canterbury) that even 24 hours is sufficient time for contaminants to accumulate

<sup>&</sup>lt;sup>12</sup> Based on modelling by Peter Christensen (CCC) for Avon SMP that shows this is a 'typical' Christchurch storm event

**Table 2.** Parameters analysed in CCC monthly and wet weather water samples taken in accordance with consenting requirements

Parameter	Units of Measurement				
Total ammonia (ammoniacal nitrogen)	mg/L				
Dissolved arsenic*	mg/L				
Biochemical Oxygen Demand (BOD₅)	mg/L				
Conductivity	μS/cm				
Total and dissolved copper	mg/L				
Dissolved Oxygen (DO)	mg/L and % saturation				
Enterococci	MPN/100ml				
Escherichia coli	MPN/100ml				
Total water hardness	g/m <sup>3</sup> as calcium carbonate				
Total and dissolved lead	mg/L				
Nitrate nitrogen	mg/L				
Nitrite nitrogen	mg/L				
Nitrate Nitrite Nitrogen (NNN)	mg/L				
Dissolved Inorganic Nitrogen (DIN)	mg/L				
рН					
Dissolved Reactive Phosphorus (DRP)	mg/L				
Total Petroleum Hydrocarbons (TPH)*	mg/L				
Total phosphorus	mg/L				
Total Suspended Solids (TSS)	mg/L				
Water temperature	D°				
Total nitrogen	mg/L				
Turbidity	NTU				
Total and dissolved zinc	mg/L				
* Wet weather samples only					

### 2.2 Stream Classifications for Guideline Levels

The classification of each waterway site with respect to the Environment Canterbury (ECan) Land and Water Regional Plan (LWRP; Environment Canterbury, 2019) and the Waimakariri River Regional Plan (WRRP; Environment Canterbury, 2011) are shown in Table 1. These classifications determine the relevant guideline levels for each of the measured parameters for the various sites. The highest species protection level (99%) applies to 'Banks Peninsula' waterways, while 'spring-fed – plains' waterways are given a 95% species protection level, and 'spring-fed – plains – urban' waterways have 90% species protection (Environment Canterbury, 2019). These species protection levels apply to toxicants (metals and ammonia), Dissolved Oxygen (DO), Dissolved Inorganic Nitrogen (DIN) and Dissolved Reactive Phosphorous (DRP).

The WRRP does not have guideline levels for several of the parameters analysed in this report. It was considered most appropriate in these cases, given these sites are all within the Ōtūkaikino River catchment, that the LWRP 'spring-fed – plains' guidelines be used. Proposed Plan Change 7 to the LWRP proposes to classify the currently unclassified Pūharakekenui/ Styx River as 'spring-fed – plains'. The two stormwater basin sites (Halswell Retention Basin Inlet and Outlet) are not classified as waterways and therefore are not compared to receiving water guidelines in this report.

#### 2.3 Water Quality Parameters and Guideline Levels

Metals, in particular, *copper*, *lead* and *zinc*, can be toxic to aquatic organisms, negatively affecting fecundity, maturation, respiration, physical structure and behaviour (Harding, 2005). The toxicity of lead and zinc in freshwater, and therefore the risk of adverse

biological effects, alters depending on several abiotic factors. These factors include, but are not limited to, organic carbon, hardness, pH, temperature, alkalinity and inorganic ligands (Warne *et al.*, 2018). The LWRP refers to default ANZG (2018) guidelines for metals. However, current recommendations are to modify these default guideline levels by water hardness (ANZG, 2018; Warne *et al.*, 2018). As such, CCC has recently updated the Hardness Modified Guideline Values (HMGV) for dissolved lead and zinc, in accordance with ANZG (2018) and Warne *et al.*, (2018) (see Appendix B). In contrast to ANZECC (2000), it is no longer recommended to modify the default copper guideline by water hardness (ANZG, 2018; Warne *et al.*, 2018).

*pH* is a measure of acidity or alkalinity, on a scale from 0 to 14; a pH value of seven is neutral, less than seven is acidic and greater than seven is alkaline. Appropriate pH levels are essential for the physiological functions of biota, such as respiration and excretion (Environment Canterbury, 2009). Aquatic species typically have tolerances for certain pH levels and alteration of pH can result in changes in the composition of fish and invertebrate communities, with generally a positive relationship between pH and the number of species present (Collier *et al.*, 1990). The guidelines in the LWRP for all waterways are a lower limit of 6.5 and an upper limit of 8.5. The WRRP, which covers the Ōtūkaikino River catchment sites in this report, does not detail a guideline level.

Conductivity is a measure of how well water conducts an electrical current. Pure water has very low conductivity, but dissolved ions in the water (e.g. contaminants such as metals and nutrients) increase conductivity. Traditionally, conductivity has been compared to the guideline value of <175  $\mu$ S/cm recommended by Biggs (1988) to avoid excessive periphyton growth. However, this guideline may be less relevant in urban waterways, where other contaminants that will not encourage periphyton growth may be contributing to high conductivity, such as metals. It is also noted that ECan do not consider this guideline value is useful, due to natural variations in levels (Abigail Bartram, ECan, personal communication 2013). They instead consider that analysis of trends is more useful, which is the approach adopted in this report.

Elevated levels of suspended sediment (*Total Suspended Solids*, TSS) in the water column decrease the clarity of the water and can adversely affect aquatic plants, invertebrates and fish (Crowe & Hay, 2004; Ryan, 1991). For example, sediment can affect photosynthesis of plants and therefore primary productivity within streams, interfere with feeding through the smothering of food supply, and can clog suitable habitat for species (Crowe & Hay, 2004; Ryan, 1991). The LWRP details in Rule 5.95 standards for TSS in stormwater prior to discharge but does not detail specifically a guideline value within waterways (Environment Canterbury, 2019). The WRRP also does not detail a guideline level. A guideline level of 25 mg/L is considered an appropriate threshold to prevent detriment effects on biota (Hayward *et al.*, 2009; Stevenson *et al.*, 2010) and is therefore used in this report.

*Turbidity* is a measure of the transmission of light through water. Suspended matter in the water column causes light to be scattered or absorbed as is travels through the water. As for TSS, turbidity decreases the clarity of the water and can negatively affect stream biota (Ryan, 1991). A guideline level for this parameter is not provided in the LWRP or the WRRP. ANZECC (2000) provides a guideline of 5.6 Nephelometric Turbidity Units (NTU) for lowland rivers, which is used in this report. This approach is consistent with current recommendations from ECan; however, this guideline will be reviewed in future reports, following publication of the proposed changes to the National Policy Statement for Freshwater Management (Michele Stevenson, ECan, personal communication, 19 June 2020).

*Water clarity* was used by the SLLT as a proxy for turbidity and TSS loads. ANZECC (2000) provides a guideline of 80 cm for lowland rivers.

*DO* is the concentration of oxygen dissolved or freely available in water and is commonly expressed as percent saturation. Adequate DO levels are essential for aquatic animals, such as fish and invertebrates, and can be influenced by many factors, including temperature, velocity, decomposition of organic material, and the photosynthesis and respiration of aquatic plants. The LWRP details a minimum DO level of 70% for 'spring-fed – plains' and 'spring-fed – plains – urban' waterways, and 90% for Banks Peninsula waterways (i.e. Cashmere Stream in this monitoring report). The WRRP details a minimum of 80% for the waterways relevant to this monitoring report (i.e. Ōtūkaikino River catchment).

High *water temperature* can affect aquatic biota, with some studies showing that the presence of sensitive macroinvertebrates decreases with increasing temperature (Wahl *et al.*, 2013). The LWRP water quality standard for temperature is a maximum of 20°C for all waterway classifications; the WRRP details a maximum of 25°C for the waterways relevant to this monitoring report (i.e. Ōtūkaikino River catchment).

*Biochemical Oxygen Demand* (BOD<sub>5</sub>) is an indicator of the amount of biodegradable organic material in the water and the amount of oxygen required by bacteria to break down this material. High BOD<sub>5</sub> values are due to plant matter, nitrogen and phosphorus, and indicate the potential for bacteria to deplete oxygen levels in the water. The LWRP does not have a guideline level for this parameter. The WRRP and the Ministry for the Environment (1992) guideline level is 2 mg/L, which is the value used in this report. However, the data presented in this report is conservative, as it relates to total BOD<sub>5</sub>, instead of the guideline requirement of filtered.

Total ammonia (ammoniacal nitrogen) is typically a minor component of the nitrogen available for plant growth, but at high levels can have toxic effects on aquatic ecosystems. The toxicity of ammonia varies with pH (ANZECC, 2000). Therefore, the LWRP water quality standards also vary depending on pH, ranging from 2.57 mg/L at pH 6 to 0.18 mg/L at pH 9 (Environment Canterbury, 2019). For this report, the water quality standard (for both monthly and wet weather sampling) was adjusted based on the median pH levels from monthly sampling for the relevant catchments. The exception to this is for Banks Peninsula waterways (i.e. Cashmere Stream in this monitoring report), that have a set guideline value regardless of pH (0.32 mg/L). The WRRP does not have a guideline level.

*Nitrate* can be toxic to stream biota at high concentrations (Hickey, 2013). Guidelines are available for different species protection levels: 99% (pristine environment with high biodiversity and conservation values), 95% (environments which are subject to a range of disturbances from human activities, but with minor effects), 90% (environments which have naturally seasonally elevated concentrations for significant periods of the year (1-3 months)), 80% (environments which are measurably degraded and which have seasonally elevated concentrations for significant periods of the year (1-3 months)), and acute (environments which are significantly degraded; probable chronic effects on multiple species) (Hickey, 2013). Based on these descriptions and the predominantly urban nature of the waterways monitored, most of the waterways in this report would fall under the 80% to acute species description (i.e. Ōtākaro/ Avon, Ōpāwaho/ Heathcote and Huritini/ Halswell River catchments). However, the Pūharakekenui/ Styx and Ōtūkaikino River catchments (and Cashmere Stream) likely fall under the 90% species

protection; these catchments have much better water quality, but exceed some of the receiving water quality guidelines throughout the year. To be conservative, the 90% species protection was chosen as the guideline level for all waterways in this report. Within this 90% level of species protection there are two guideline values: the 'grading' guideline (3.8 mg N/L) that provides for ecosystem protection for average long-term exposure (measured against medians) and the 'surveillance' guideline (5.6 mg N/L) that assesses seasonal maximum concentrations (measured against annual 95<sup>th</sup> percentiles). Both guideline levels have been assessed in this report to investigate both long-term and short-term effects. It is also noted that Schedule 8 (region-wide water quality limits) of ECan's LWRP gives a nitrate toxicity limit for lowland streams of 3.8 mg N/L (measured against annual median).

Elevated concentrations of *Nitrate and Nitrite Nitrogen* (NNN) can lead to proliferation of algae and aquatic plants (i.e., eutrophication), because nitrate and nitrite are oxidised forms of nitrogen that are readily available to plants. Eutrophication occurs at much lower nitrate concentrations than toxicity. The LWRP and the WRRP do not have a guideline value for this parameter, but the ANZECC (2000) water quality guidelines provide a guideline value of 0.444 mg/L for lowland rivers to avoid excessive plant growth. Note that this guideline is based on the 80<sup>th</sup> percentile of measurements from three lowland reference sites, so it is not "effects-based". Rather, compliance with the guideline will also protect against nitrate toxicity.

*DIN*, which is the sum of ammonia, nitrite and nitrate, provides a similar measure of eutrophication risk to NNN. The LWRP details a DIN value of 1.5 mg/L for 'spring-fed – plains' and 'spring-fed – plains – urban' waterways, and 0.09 mg/L for Banks Peninsula waterways. The DIN guideline of 1.5 mg/L is based on the median of Canterbury Spring-fed plains streams, whereas the 0.09 mg/L guideline is derived from the New Zealand Periphyton Guideline, based on flow data from Canterbury streams (Biggs, 2000; Hayward *et al.*, 2009). There is no DIN guideline value in the WRRP.

*DRP* is a soluble form of phosphorus that is readily available for use by plants. Phosphorus is an essential nutrient for plant growth and can limit primary production at low levels, but can cause eutrophication at high levels. The guideline levels in the LWRP for 'spring-fed - plains' and 'spring-fed – plains – urban' waterways are 0.016 mg/L, and 0.025 mg/L for Banks Peninsula waterways. There is no guideline value for this parameter in the WRP.

*Escherichia coli* is a bacterium that is commonly used as an indicator of faecal contamination in freshwater and therefore health risk from contact recreation (Ministry for the Environment, 2003). The guideline level in the LWRP for 'spring-fed – plains', 'spring-fed – plains – urban' and Banks Peninsula waterways is 550 *E. coli* per 100ml (for 95% of samples). The WRRP does not have a guideline value for this parameter.

*TPH* is the term used to describe a wide variety of chemical compounds that are found in oil and petroleum-based products. Some of the hydrocarbons found in petroleum products are toxic to aquatic life. In addition, hydrocarbons are broken down by microbial activity that then reduces oxygen levels in the water, which can also be harmful to sensitive fish and invertebrate species (ANZECC 2000). There are no guidelines for TPH in New Zealand freshwaters.

### 2.4 Data Analysis

#### 2.4.1 Summary Statistics and Graphs

Boxplots (for monthly data) were produced using the program RStudio (Version 1.2.5033). To allow statistical analyses of monthly samples, values less than the LOD were converted to half the detection limit. In some years, monthly *E.coli* levels exceeded the maximum laboratory limit for counting (24,000 MPN/100ml) and were analysed as 24,000, although levels may have been much higher than this. There were two such *E. coli* cases during the 2019 monitoring year.

The dark lines in the boxes of the boxplots represent the medians, and the bottom and top lines of the boxes represent the 25<sup>th</sup> and 75<sup>th</sup> percentiles (the interquartile range), respectively. The T-bars that extend from the boxes approximate the location of 90% of the data (i.e. the 5<sup>th</sup> and 95<sup>th</sup> percentiles, HAZEN methodology). Circles represent outliers. In some cases, boxplots do not show all components, such as the percentiles, due to a lack of variation in the data, with some showing only the medians. This usually occurred where a large proportion of the data were below the laboratory limit of detection.

In line with the respective guideline documents and ECan guidance (Dr Lesley Bolton-Ritchie, Environment Canterbury, 6<sup>th</sup> April 2016, personal communication), the monthly data were compared to guideline levels using median levels. The exceptions being for *E. coli*, toxicants (metals and ammonia) and the 'surveillance' nitrate level, which were compared to the 95<sup>th</sup> percentiles.

#### 2.4.2 Temporal Trends Analysis

Temporal trends analysis was carried out on the monthly data from each of the sites, to determine whether water quality is declining, improving or staying the same over time. Some of the sites have been monitored for longer periods than others, as detailed in Appendix C, Table i. Dissolved metals have only been analysed since 2011, with total metals sampled prior to this. Dissolved metals are now considered to be more relevant because they constitute the bio-available proportion of metals that can have adverse effects on biota (ANZECC, 2000). The guidelines also essentially pertain to dissolved metal concentrations, not total metals. As NNN is predominantly comprised of nitrate, trends analysis was also only conducted on NNN and not nitrate as well.

Trends analysis was conducted using Time Trends V 6.3, build 14 (NIWA, 2014). The Seasonal Kendall trend test was used to test the significance, magnitude and direction of the trends, providing an average annual percentage change. A change was considered meaningful when there was a statistically significant positive or negative result of greater than 1% (NIWA, 2020). In previous reports, any statistically significant results between -0.99 and 0.99 were identified, but this is no longer considered appropriate, given the above information defining what is meaningful. Time Trends (V 6.3) accommodates for variable LODs, and the option for using censored values in Sen slope calculation was selected. This software requires three years of data and all CCC sites met this requirement. However, when a large proportion of data is below the LOD (e.g. dissolved copper and lead) or missing (e.g. missing SLLT data in some years) these analyses may be less accurate. SLLT monitoring included five new sites in 2018/2019: Kā Pūtahi at Blakes Rd, Styx Drain at Redbrook Rd, Smacks at Wilkinsons Rd, Rhodes Drain at Hawkins Rd and Horner's Drain at Hawkins Rd. Therefore, there was insufficient data to run trends analysis for these sites.

Concentrations of parameters may vary depending on flow rates at the time of sampling, due to variations in the level of dilution. Therefore, flow-adjusted data can be used in the Time Trends software to account for this potentially confounding factor. However, a flow recorder is only directly present at one of the sites (Heathcote at Ferniehurst St). It is considered that extrapolation of this flow data to other locations, as well as the use of other flow gauges in Christchurch not directly at the monitoring sites, may bias the results through differences in habitat and additional discharge inputs. This may lead to inaccurate trend conclusions. Given the long period of monitoring, it is considered that variations in flow rates between sampling events will not strongly influence the trends analysis, as most events will have been conducted during baseflow conditions. To ensure accurate comparisons between sites, the flow data for Heathcote River at Ferniehurst St was not used.

This monitoring year, an issue was encountered when analysing the  $BOD_5$  data in Time Trends. At most sites the direction of change could be calculated, but not the magnitude (i.e. %). This was due to the programme being unable to deal with the high proportion of censored (below the LOD) data. It is unclear whether this will continue to be an issue in future reports, as it is dependent on the results of future testing. CCC is currently investigating lowering the LOD to mitigate these potential impacts.

#### 2.4.1 Water Quality Index

A Water Quality Index (WQI) was developed for the CCC monthly monitoring sites, based on a Canadian WQI (CCME; Canadian Council of Ministers for the Environment, 2001). This index uses three factors to assess water quality: scope (the percentage of parameters not meeting the guideline on at least one occasion); frequency (the percentage of samples that did not meet the guideline); and amplitude (the amount by which the guideline was not met). The WQI ranges from 0 - 100, with 100 representing high water quality. The user can choose which parameters to include and what guideline levels are appropriate to their system.

The parameters used in the CCC WQI were copper, zinc, pH, TSS, DO, temperature, BOD<sub>5</sub>, total ammonia, NNN, DRP and *E. coli*. WQI scores were used to categorise the CCC sites as being 'very poor' (0 - 39.99), 'poor' (40 - 69.99), 'fair' (70 - 79.99), 'good' (80 - 89.99) or 'very good (90 - 100). The categories were selected based on local knowledge of water quality compared to other waterways nationally. These categorise Christchurch City waterways as expected. The WQI index was calculated for every year from 2013, to allow comparisons over time. The update to the hardness modified guideline values for dissolved metals affected the calculation of the WQI. Therefore, WQI scores from 2013–2018 were recalculated using the new dissolved copper and zinc guideline values, to enable accurate temporal changes to be determined (Section 2.3; Appendix B). Auckland Council (Holland *et al.*, 2016) and ECan (Robinson & Stevenson, 2016) have also adapted this CCME WQI index for their own purposes. However, because the parameters used to calculate these indices and/or their categories are different, these indices cannot be compared.

To test for significant relationships in WQI between catchments and years, statistical models were run in the program RStudio (Version 1.2.5033). Generalised Linear Mixed Effects Models with a binomial error structure and logit link function were used (Crawley, 2007), with the following combinations of fixed effects: (1) a null model with intercept

only; (2) a model that considered 'year'; (3) a model that considered 'catchment'; and (4) a model that considered the interaction between 'year' and 'catchment'. 'Year' was also included in each model as a random effect to account for temporal autocorrelation (repeated measures). 'Site' was also included as an observational level random effect, due to the models exhibiting overdispersion (Harrison, 2014; Harrison, 2015). Boxplots of WQI across years were also graphed in R for each catchment (see the explanation of how to interpret boxplots in the Summary Statistics and Graphs section).

Temporal trends analysis was carried out on the WQI at each site, to determine whether overall water quality is declining, improving or staying the same over time. Analysis was undertaken on data collected from 2013- 2019 inclusive. Trends analysis was conducted using Time Trends (NIWA, 2020). The Seasonal Kendall trend test was used to test the significance, magnitude and direction of the trends, providing an average annual percentage change. This software requires three years of data and all sites met this requirement. A change was considered meaningful when there was a statistically significant positive or negative result of greater than 1% (NIWA, 2020).

# **3** Results: Monthly Monitoring

## 3.1 Rainfall

- Daily rainfall has been collected at the Christchurch Botanic Gardens by the CCC since the early 1960's.
- Over the last five years rainfall has been variable, including dry years (2015 and 2016), wet years (2017 and 2018) and intermediate years (2019) (Figure 2).
- For the 2019 monitoring year (for the CCC monthly data only) the Ōtūkaikino catchment recorded the most number of sampling days affected by rain (47%), followed by the Pūharakekenui/ Styx River catchment (44%), Ōtākaro/ Avon River catchment (29%), Linwood Canal catchment (25%), Ōpāwaho/ Heathcote River catchment (15%) and Huritini/ Halswell River catchment (8%). This was based on observations of the water quality samplers as to whether it had rained within the 24 hours prior to sampling.

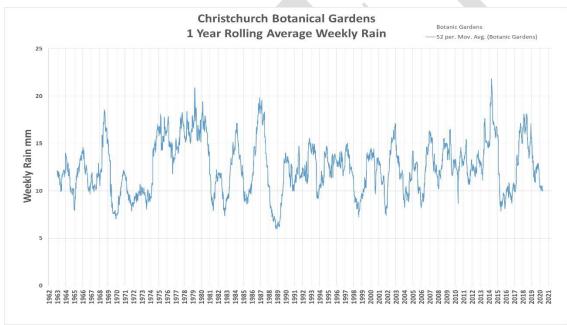

Figure 2. Average weekly rainfall at the Botanic Gardens in Hagley Park

## 3.2 Water Quality Parameters

### 3.2.1 Summary

• Over 11,000 tests were conducted during the monitoring year for the CCC monthly monitoring, with 7,440 of these allowing the assessment of each waterway site against relevant guideline levels (Table 3). Twenty percent of these samples did not meet the guideline level, with 41 sites (97.6%) not meeting the guideline for at least one parameter.

- The parameters that were exceeded at the most sites were *E. coli* (36 sites), NNN (32 sites), and DRP and dissolved copper (both 23 sites). The NNN guideline was exceeded most frequently (80% of samples), followed by DRP (54% samples) and DIN (41% of samples).
- Most parameters did not change in concentration since monitoring began, with 420 (64%) parameter-site combinations recording no significant upwards or downwards trends in concentrations (Appendix D, Tables i–iv). However, 182 (28%) parameter-site combinations recorded a significant improvement in water quality, 50 (8%) recorded a significant decline in water quality, and 1 (0.2%) recorded a significant change that could represent either a decline or improvement in water quality (pH).
- The majority of sites across all catchments recorded a small decrease in BOD<sub>5</sub>, DRP and NNN/DIN. Many sites in the Pūharakekenui/ Styx River recorded an increase in *E. coli* levels.
- The largest increases in parameter concentrations at individual sites were:
  - 18% for NNN and 16% for DIN at the Ōtūkaikino at Scout Camp site, due to some high peaks in concentrations in 2017–2019 (Figures 3 – 4)
  - 16% in dissolved zinc at Curletts at Motorway, due to a steady increase over time (Figure 5)
- The largest decreases in parameter concentrations at individual sites were:
  - 33% for total ammonia (driven by concentrations peaking in 2011 and lower concentrations since then), 28% for dissolved lead (due to peak levels in 2014-2016 and generally lower concentrations since then) and 19% for TSS at the Halswell Basin Outlet site (with concentrations generally decreasing over time) (Figures 6 – 7, 10)
  - 31% for NNN and 24% for DIN at the Curletts at Motorway site, due to lower levels since 2016 (Figures 8 – 9)
- Whilst not classified as one of the largest changes over time above, the following results are of interest:
  - 12% increase in copper at the Curletts at Motorway site, due to a large increase since early 2019
  - 12% increase in ammonia at the Wilsons Stm site, due to a steady increase over time; however, levels are still low overall. This is of note as this trend is unusual, and this parameter is extremely toxic to biota and is typically associated with industry.
  - 16% and 13% reduction in copper and lead, respectively, at Curletts U/S of Heathcote, due to steady decreases over time
  - 18% decrease in DRP at Cashmere Stream at Sutherlands Rd, due to reductions in large peaks since 2014
- Although there was no significant change in either TSS or turbidity at the Cashmere at Worsleys Rd site, there is potentially a steady increase in these parameters occurring, and this should be assessed carefully in next year's report to see if levels decrease or increase (Figures 11–12).

### 3.2.2 Dissolved Copper

- 95<sup>th</sup> percentiles for most sites in the Ōtākaro/ Avon and Ōpāwaho/ Heathcote catchments, as well as at the Ōtūkaikino at Groynes and Linwood Canal sites exceeded their respective guideline levels (Appendix E, Figure i (a) (b)).
- Copper levels were generally higher in the Ōtākaro/ Avon and Ōpāwaho/ Heathcote catchments compared to the other catchments.

- Of the three highest values recorded (0.018 mg/L, 0.017 mg/L and 0.014 mg/L), all were from the Curletts at Motorway site and only the lowest of these values was associated with rain.
- The Halswell Basin sites recorded levels generally higher than the waterway sites, except for the Curletts at Motorway site. Levels were higher at the inlet compared to the outlet.
- Concentrations have remained stable (i.e. there were no significant trends) since regular monitoring of dissolved metals was instigated, except for the Curletts U/S of Heathcote (decrease of 16%), Halswell Basin Outlet (decrease of 7%) and Curletts at Motorway (increase of 12%) sites (Appendix D, Tables i–iv).

### 3.2.3 Dissolved Lead

- All 95<sup>th</sup> percentiles for each site complied with the respective guidelines (Appendix E, Figure ii (a) (b)).
- Lead levels were generally higher in the Ōtākaro/ Avon and Ōpāwaho/ Heathcote catchments compared to the other catchments.
- The three highest values were all from the lower Heathcote River: Heathcote at Mackenzie Ave (0.0096 mg/L), Heathcote at Catherine St (0.0059 mg/L) and Heathcote at Tunnel Rd (0.0049 mg/L). Only the highest value was associated with rain; however, all three samples were taken during a period when upstream dredging was occurring (CCC, *unpublished data*).
- Levels with the Halswell Basin sites were generally higher compared to most waterway sites, and higher at the inlet than the outlet.
- Much higher lead levels were recorded at the Heathcote at Catherine St, Heathcote at Tunnel Rd and Heathcote at Ferrymead Bridge sites compared to 2018. These samples were all associated with upstream dredging.
- Concentrations remained stable over time at all sites except the Halswell Basin Outlet (Figure 7), Dudley Creek and Curletts U/S of Heathcote sites, which recorded 32%, 15%, and 13% reductions, respectively (Appendix D, Tables i–iv).

### 3.2.4 Dissolved Zinc

- 95<sup>th</sup> percentiles for most sites in the Ōtākaro/ Avon, approximately half of the sites in the Ōpāwaho/ Heathcote catchments, as well as the Kā Pūtahi at Blakes Rd and Nottingham at Candys Rd sites, all exceeded their respective guideline levels (Appendix E, Figure iii (a) – (b)).
- Zinc levels were generally higher in the Ōtākaro/ Avon and Ōpāwaho/ Heathcote catchments compared to the other catchments.
- The three highest values (0.77 mg/L, 0.60 mg/L and 0.52 mg/L) were from the Curletts at Motorway site and only the second highest was associated with rain.
- Levels in the Halswell Basin sites were generally higher than the waterway sites, t.
- Sites within areas with high industrial and commercial land use, such as Addington Brook, Curletts Stream and Haytons Stream, typically had higher concentrations than the rest of their respective catchments.
- Concentrations have generally remained stable since sampling was instigated (Appendix D, Tables i–iv). A few sites showed large decreases: Wairarapa Stm (13%), Heathcote at Templetons Rd (13%), Styx at Gardiners Rd (11%), Smacks at Gardiners Rd (16%) and Ōtūkaikino at Groynes (17%). However, large increases were recorded at Curletts at Motorway (16%; Figure 5), with a particularly large peak recorded in April of the monitoring year, and Heathcote at Ferrymead Bridge (14%).

## 3.2.5 pH

- Medians of all CCC and SLLT waterway sites complied with the guideline levels (Appendix D, Figure iv (a) (c)).
- The three highest values at the waterway sites were from Haytons Stm (9.5), Curletts at Motorway (8.6) and Avon at Pages Rd (8.2 on two occasions), and Avon at Bridge St (8.2), with none of these values recorded in association with rain. The lowest recorded pH of 6.5 was at the Heathcote at Templetons Rd site and was not associated with rain.
- The Halswell Basin sites recorded substantially higher pH than the waterway sites. Levels were slightly lower at the outlet than the inlet.
- Concentrations remained stable over time, except for small very increases at Ōtūkaikino at Scout Camp and most SLLT sites where trends analysis could be run (Appendix D, Tables i–v).

## 3.2.6 Conductivity

- No relevant guidelines exist for conductivity.
- The tidal sites had greater conductivity and variability in values than non-tidal sites, due to saline influence (Appendix D, Figure v (a) – (c)).
- Addington Brook and both Curletts Road Stream sites had more variability and higher concentrations compared to other non-tidal sites, indicating pollution sources.
- Both Halswell Basin sites had levels comparable to the waterway sites, and levels were slightly lower at the outlet.
- Conductivity at the SLLT sites were similar to the CCC waterway sites.
- Of particular note was a substantial increase at the three lower sites in the Heathcote catchment compared to 2018. At these sites, medians increased by 1.5–3.7 fold, minimums by 1–4 fold and maximums by 1.7–12.6 fold.
- Concentrations generally did not change over time by any large degree, with increases from 1–8% and decreases from 1–4% (Appendix D, Tables i–v).

## 3.2.7 TSS

- Medians of all waterway sites complied with the guideline level, except for Heathcote at Tunnel Rd and Heathcote at Ferrymead Bridge (Appendix D, Figure vi (a) (b)).
- The three highest TSS values were recorded from the Ōpāwaho/ Heathcote catchment in association with dredging: Heathcote at Opawa Rd (310 mg/L, 210 mg/L) and Heathcote at Mackenzie Ave (140 mg/L), with no values recorded in association with rain.
- The Halswell Basin Inlet generally recorded levels higher than the waterway sites. Levels were lower at the outlet than the inlet.
- Typically, higher TSS was recorded in the lower, tidal sites of the Ōtākaro/ Avon and Ōpāwaho/ Heathcote catchments, potentially due to resuspension of the naturally softer substrate at these locations compared to non-tidal sites.
- Concentrations at the Heathcote at Mackenzie Ave site were much higher in 2019 compared to 2018.
- The Halswell Basin Outlet was the only site to record a substantial change in concentrations over time, with a 20% decrease recorded (Figure 10; Appendix D, Tables i–iv).

## 3.2.8 Turbidity

- The medians of the following sites exceeded the guideline: Addington Brook, Avon at Bridge St, Haytons Stm, Cashmere at Worsleys Rd, Heathcote at Ferniehurst St, Heathcote at Opawa Rd, Heathcote at Tunnel Rd, Heathcote at Ferrymead Bridge and Linwood Canal (Appendix D, Figure vii (a) – (b)).
- The three highest turbidity readings were recorded from the Ōpāwaho/ Heathcote catchment: Heathcote at Opawa Rd (110 NTU, 140 NTU) and Heathcote at Tunnel Rd (46 NTU). None of these recordings were associated with rain; however, they were all recorded in association with dredging (CCC, *unpublished data*).
- The Ōpāwaho/ Heathcote River catchment, followed by the Ōtākaro/ Avon River catchment, generally recorded higher turbidity levels compared to the other catchments. The lower three Ōpāwaho/ Heathcote River tidal sites typically recorded higher turbidity than the other sites in this catchment.
- The most substantial decrease over time (11%) was at the Ōtūkaikino at Groynes site and the most substantial increase (13%) was at the Wilsons Stm site (Appendix D, Tables i–iv).

## 3.2.1 Water Clarity (SLLT sites only)

- The medians of all sites did not comply with the guidelines, except for Smacks at Wilkinsons Rd and Styx Drain at Redbrook Rd (Appendix D, Figure viii).
- The three highest values were from Horner's Drain at Hawkins Rd (32 cm, 35 cm and 45 cm).
- Except for Horner's Drain at Hawkins Rd and Rhodes Drain at Hawkins Rd, water clarity was similar across sites, and between the mainstem and tributaries.
- No substantial changes in levels were recorded over time (Appendix D, Table v).

## 3.2.2 DO

- Medians of the following sites did not meet the guideline: Horseshoe Lake, Heathcote at Templetons Rd, both Curletts Road Stream sites, both Cashmere Stream sites, Styx at Gardiners Rd, Smacks at Gardiners Rd and Linwood Canal (Appendix D, Figure ix (a) – (b)).
- The three lowest readings were 13% and 20% (Curletts U/S of Heathcote), and 23% (Curletts at Motorway). None of these records were associated with rain.
- DO levels were generally higher at the Halswell Basin Outlet than the Inlet, and both sites were fairly comparable to the waterway sites.
- Dissolved oxygen levels were lower in the Ōpāwaho/ Heathcote catchment, particularly at the upstream sites.
- Levels did not change over time by any large degree at any of the sites (Appendix D, Tables i–iv).

### 3.2.3 Water Temperature

- Medians of all CCC and SLLT sites complied with their respective guidelines (Appendix D, Figure x (a) – (c)).
- The three highest readings from the waterway sites were from Linwood Canal (22.8 °C, 22.4 °C), Heathcote at Tunnel Rd (22.4 °C) and Heathcote at Ferrymead Bridge (22.2 °C).

- The inlet and the outlet of the Halswell Retention Basin recorded similar levels to each other, and. These two sites typically recorded higher and more variable temperatures than the waterway sites.
- The SLLT sites recorded generally similar temperatures to the CCC sites.
- Levels did not change over time by any large degree (Appendix D, Tables i–v).

#### 3.2.4 BOD<sub>5</sub>

- Medians of all waterway sites complied with the guideline (Appendix D, Figure xi (a) (b)).
- The highest values recorded at the waterway sites were from Kā Pūtahi at Blakes Rd (5.9 mg/L), Curletts U/S of Heathcote (4.2 mg/L) and Haytons Stm (3.6 mg/L). None of these values were recorded in association with rain.
- Levels in the Halswell Basin sites were generally higher than the waterway sites and levels were lower at the outlet.
- Levels were typically higher in the Ōtākaro/ Avon River and Ōpāwaho/ Heathcote River catchments.
- Compared to 2018, concentrations were markedly lower at the Curletts at Motorway and Heathcote at Ferrymead Bridge sites.
- Most sites across all catchments recorded decreases in BOD<sub>5</sub> since sampling began (Appendix D, Tables i–iv).

#### 3.2.5 Total Ammonia

- 95<sup>th</sup> percentiles of all sites complied with their respective guidelines (Appendix D, Figure xii (a) – (b)).
- The three highest levels within the waterway sites were from the Linwood Canal (0.57 mg/L, 0.56 mg/L) and Haytons Stm (0.55 mg/L) sites, with only the Haytons Stm sample associated with rain
- The Halswell Basin Inlet generally recorded values higher than the waterway sites, and levels were substantially lower at the outlet.
- Ammonia was generally higher in the tributaries compared to mainstems.
- Over half of sites remained stable over time (Appendix D, Tables i–iv). The following sites recorded large decreases in concentrations: Halswell Basin Outlet (33%), Halswell Basin Inlet (25%; Figure 6) and Heathcote at Ferrymead Bridge (13%). Wilsons Stm recorded a significant increase of 12%.

### 3.2.6 Nitrate, NNN and DIN

- Heathcote at Templetons Rd and Knights at Sabys Rd recorded much higher levels of nitrogen than the other sites, with the three highest exceedances of nitrate, NNN and DIN from these sites: Heathcote at Templetons Rd (DIN: 4.4 mg/L and 4.3 mg/L (three samples)), Knights at Sabys Rd (DIN: 4.4 mg/L (two samples)), 4.3 mg/L (two

samples) and 4.2mg/L). Only one record was associated with rain (4.3 mg/L at the Heathcote at Templetons Rd site).

- Both Halswell Basin sites recorded levels comparable to the waterway sites. Levels at the outlet and inlet were generally comparable.
- All three parameters typically decreased downstream in the mainstem, and were lower in the Pūharakekenui/ Styx, Ōtūkaikino and Linwood Canal catchments.
- NNN and DIN concentrations generally remained stable or decreased over time, with over 50% of sites recording a decrease in at least one parameter (Appendix D, Tables i–iv). Comparatively large decreases were recorded at Curletts at Motorway (NNN = 30%, DIN = 24%; Figures 8 and 9), Halswell Basin Outlet (DIN = 18%), Halswell Basin Inlet (DIN = 15%), and Haytons Stm (NNN = 11%, DIN = 14%). An increase in NNN (18%) and DIN (16%) was recorded at Ōtūkaikino at Scout Camp, due to some high peaks in concentrations in 2017–2019 (Figures 3–4).

#### 3.2.7 DRP

- The medians of over half of the sites did not comply with their respective guidelines, with the majority of sites in the Opāwaho/ Heathcote exceeding this value (Appendix D, Figure xvi (a) – (b)).
- Particularly high levels were recorded in Haytons Stm, with the three highest values (0.43 mg/L, 0.35 mg/L and 0.27 mg/L) from this site. Only the highest value was associated with rain.
- The Halswell Basin sites were within the higher range of the waterway sites, and concentrations were slightly lower at the outlet.
- DRP generally increased downstream in the catchments.
- Most sites recorded a decrease in DRP concentrations since monitoring began (Appendix D, Tables i–iv). The largest decreases were from Cashmere at Sutherlands Rd (18%), Ōtūkaikino at Groynes (14%), Heathcote at Ferrymead Bridge (14%), Heathcote at Templetons Rd (12%), Haytons Stm (11%), and Halswell Basin Outlet (11%). No site increased in concentration.

#### 3.2.8 E. coli

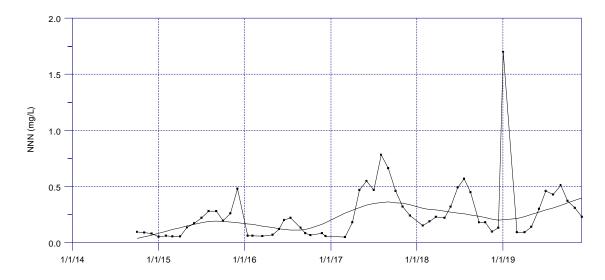

- The 95<sup>th</sup> percentiles for Heathcote at Templetons Rd, Haytons Stm, Curletts U/S of Heathcote, Cashmere at Sutherlands Rd, Ōtūkaikino at Scout Camp and Ōtūkaikino at Groynes all complied with the guideline level (Appendix D, Figure xvii (a) – (b)). Levels were exceeded at all other sites. In 2018, Cashmere at Sutherlands Rd was the only site to comply with the guideline level.
- The highest value (>24,000 MPN/100ml) was recorded on one occasion each at the Riccarton Main Drain and Nottingham at Candys Rd sites. The next highest record of 16,000 MPN/100ml was from Dudley Creek, while the third highest (12,000 MPN/100ml) was from Kā Pūtahi at Belfast Rd. Only the Kā Pūtahi at Belfast Rd record was associated with rain. No *E. coli* samples were associated with a recorded CCC wastewater overflow event.
- The Halswell Basin sites were within the range of that recorded at the waterway sites, and the outlet concentrations were generally lower than the inlet.
- Concentrations generally remained stable over time (Appendix D, Tables i–iv). The largest changes were recorded at Curletts U/S of Heathcote (13% decrease) and Wilsons Stm (13% increase).

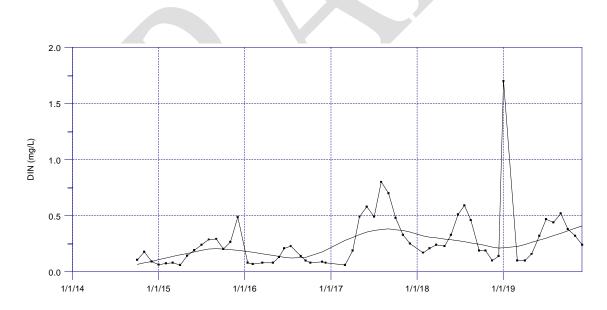

**Table 3.** Number of waterway sites monitored for each parameter (where guideline levels are available), the number of samples analysed and the number of samples and sites (based on medians/95<sup>th</sup> percentiles, depending on the parameter) not meeting the guideline levels, during the monitoring period of January to December 2019.

Parameter	Guideline	Number of Sites Monitored	Number of Samples Analysed	Number of Samples Not Meeting Guideline	Number of Sites Not Meeting Guidelines
Escherichia coli	95%the percentile <550/100ml	42	500	147 (29.4%)	36
Nitrate Nitrite Nitrogen	Median <0.444 mg/L	42	500	399 (79.8%)	32
Dissolved Reactive Phosphorus	Varies depending on catchment, from median <0.016 mg/L to <0.025 mg/L	42	500	269 (53.8%)	23
Dissolved copper	Varies depending on catchment, from 95 <sup>th</sup> percentile <0.001 mg/L to <0.0018 mg/L	42	500	47 (9.4%)	23
Dissolved zinc	Varies depending on catchment, from 95 <sup>th</sup> percentile <0.00634 mg/L to <0.12691 mg/L	42	500	51 (10.2%)	18
Dissolved Inorganic Nitrogen	Varies depending on catchment, from median <0.09 mg/L to <1.5 mg/L	42	500	204 (40.8%)	17
Turbidity	Median <5.6 NTU	37	440	120 (27.3%)	9
Dissolved oxygen	Varies depending on catchment, from median >70% to >90%	42	500	125 (25.0%)	9
Total Suspended Solids	Median <25 mg/L	42	500	48 (9.6%)	2 (Heathcote at Tunnel Rd, Heathcote at Ferrymead Bridge)
Nitrate	Median <3.8 mg/L and/or 95%ile <5.6 mg/L	42	500	21 (4.2%)	2 (Heathcote at Templetons Rd, Knights Stream)
Biochemical Oxygen Demand	Median <2 mg/L	42	500	16 (3.2%)	0
Water temperature	Varies depending on catchment, from median <20°C to <25°C	42	500	13 (2.6%)	0
рН	Median 6.5 to 8.5	42	500	3 (0.6%)	0
Dissolved lead	Varies depending on catchment, from 95 <sup>th</sup> percentile <0.00427 mg/L to <0.13610 mg/L	42	500	0 (0%)	0
Total ammonia	Varies depending on catchment, from 95 <sup>th</sup> percentile <0.32 mg/L to <1.99 mg/L	42	500	0 (0%)	0
Total	-	42	7,440	1,463 (19.7%)	41 of 42 (97.6%) (for at least one parameter)

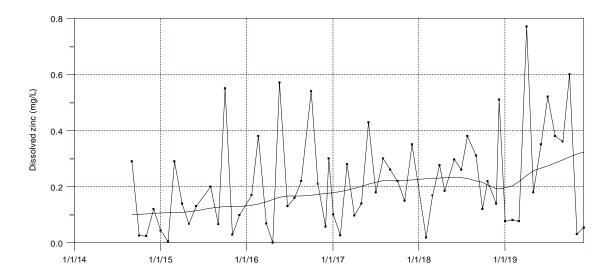

**Figure 3.** NNN levels at the Ōtūkaikino at Scout Camp site for the monitoring period October 2014 to December 2019. Squares indicate individual sampling events. The trendline was fitted using the Locally Weighted Scatterplot Smoothing (LOWESS) method in the Time Trends software. A positive (i.e. increasing) trend of 18% was recorded over the sampling period.

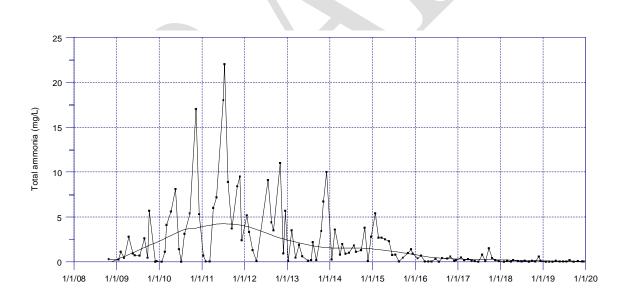

**Figure 4.** DIN levels at the Ōtūkaikino at Scout Camp site for the monitoring period October 2014 to December 2019. Squares indicate individual sampling events. The trendline was fitted using the Locally Weighted Scatterplot Smoothing (LOWESS) method in the Time Trends software. A positive (i.e. increasing) trend of 16% was recorded over the sampling period.

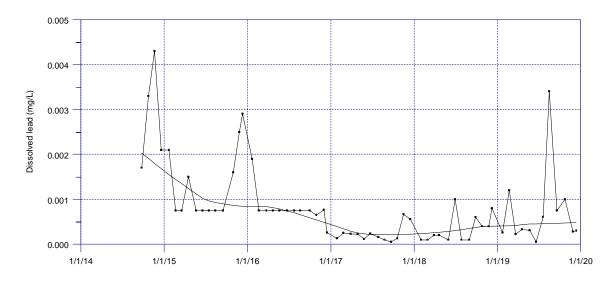

**Figure 5.** Dissolved zinc levels at the Curletts at Motorway site for the monitoring period September 2014 to December 2019. Squares indicate individual sampling events. The trendline was fitted using the Locally Weighted Scatterplot Smoothing (LOWESS) method in the Time Trends software. A positive (i.e. increasing) trend of 16% was recorded over the sampling period.

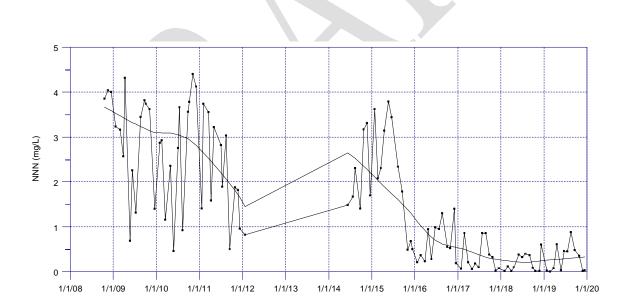

**Figure 6.** Total ammonia levels at the Halswell Basin Outlet site for the monitoring period October 2008 to December 2019. Squares indicate individual sampling events. The trendline was fitted using the Locally Weighted Scatterplot Smoothing (LOWESS) method in the Time Trends software. A negative (i.e. decreasing) trend of 33% was recorded over the sampling period.

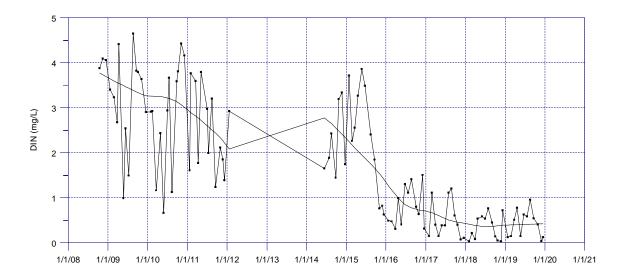

**Figure 7.** Dissolved lead levels at the Halswell Basin Outlet site for the monitoring period September 2014 to December 2019. Squares indicate individual sampling events. The trendline was fitted using the Locally Weighted Scatterplot Smoothing (LOWESS) method in the Time Trends software. A negative (i.e. decreasing) trend of 28% was recorded over the sampling period.

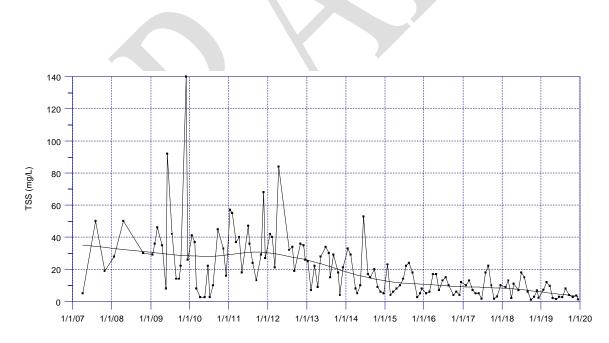

**Figure 8.** NNN levels at the Curletts at Motorway site for the monitoring period October 2008 to December 2019. Squares indicate individual sampling events. The trendline was fitted using the Locally Weighted Scatterplot Smoothing (LOWESS) method in the Time Trends software. A negative (i.e. decreasing) trend of 31% was recorded over the sampling period. This site was unable to be sampled from February 2012 – May 2014, due to motorway construction.

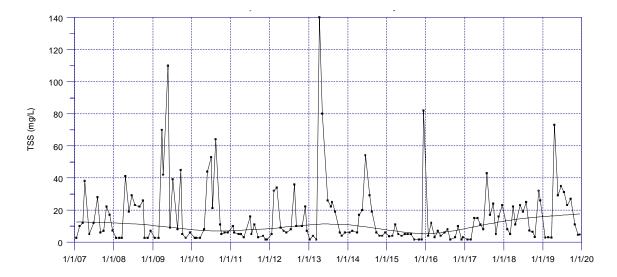

**Figure 9.** DIN levels at the Curletts at Motorway site for the monitoring period October 2008 to December 2019. Squares indicate individual sampling events. The trendline was fitted using the Locally Weighted Scatterplot Smoothing (LOWESS) method in the Time Trends software. A negative (i.e. decreasing) trend of 24% was recorded over the sampling period. This site was unable to be sampled from February 2012– May 2014, due to motorway construction.

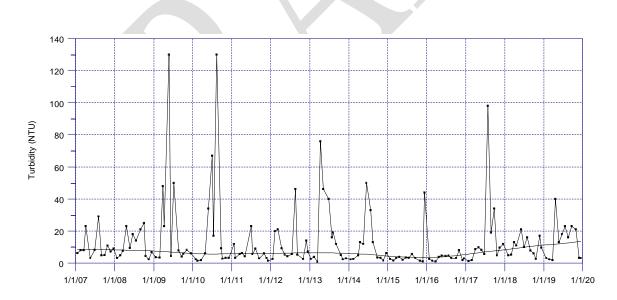

**Figure 10.** TSS levels at the Halswell Basin Outlet site for the monitoring period April 2007 to December 2019. Squares indicate individual sampling events. The trendline was fitted using the Locally Weighted Scatterplot Smoothing (LOWESS) method in the Time Trends software. A negative (i.e. decreasing) trend of 20% was recorded over the sampling period.

**Figure 11.** TSS levels at the Cashmere at Worsleys Rd site for the monitoring period January 2007 to December 2019. Squares indicate individual sampling events. The trendline was fitted using the Locally Weighted Scatterplot Smoothing (LOWESS) method in the Time Trends software. No significant trend was recorded over the sampling period.

**Figure 12.** Turbidity levels at the Cashmere at Worsleys Rd site for the monitoring period January 2007 to December 2019. Squares indicate individual sampling events. The trendline was fitted using the Locally Weighted Scatterplot Smoothing (LOWESS) method in the Time Trends software. No significant trend was recorded over the sampling period.

### 3.3 Water Quality Index

- 59.5%, 23.8% and 16.7% of sites were recorded as having 'poor', 'fair' and 'good' water quality, respectively (Table 4; Figure 13). No site had 'very poor' or 'very good' water quality, the latter being because the guidelines were exceeded on at least one occasion at all sites.
- All catchments generally recorded 'poor' or 'fair' water quality, except the Ōtūkaikino River and the upper Pūharakekenui/ Styx, which recorded 'good' water quality (Table 4; Figure 14).
- The Ōtūkaikino River recorded the best water quality out of all the catchments and Ōpāwaho/ Heathcote catchment recorded the worst water quality (Table 5).
- The best sites for water quality was jointly Styx at Main North Rd and Ōtūkaikino at Scout Camp, followed by Ōtūkaikino at Groynes, and then Smacks at Gardiners Rd (Table 5).
- The worst site for water quality was Curletts at Motorway, followed by Heathcote at Tunnel Rd, and then Haytons Stm and Heathcote at Ferrymead Bridge (Table 5).
- The best fitting statistical model was the 'catchment' and 'year' interaction model, meaning that some catchments, but not all, varied in WQI depending on the year of survey (x<sup>2</sup> = 253.99, d.f.= 35, p<0.0001; Figure 14):</li>
  - Ōtākaro/ Avon: initially showed an improvement in WQI over time, peaking in 2016 with the median WQI in the 'good' category. However, the median has since declined and now falls in the 'poor' category, where it was in 2013.
  - Opāwaho/ Heathcote: no improvement in WQI over time, with the median WQI always within the 'poor' category.
  - Huritini/ Halswell: some improvement in WQI over time; however, median WQI has remained in the 'poor' category for all years. The catchment consists of only three sites which may not be a thorough representation of the catchment.
  - Pūharakekenui/ Styx: has recorded an improvement in WQI over time, improving from the 'poor' category in 2013 to 'good' in 2019. However, water quality regressed to the 'poor' category in 2018.
  - Ōtūkaikino: very variable WQI scores over the years, with the median WQI moving between the 'poor' and 'very good' categories. However, this catchment consists of only three sites which may not be a thorough representation of the catchment.
  - Linwood Canal: has recorded no overall improvement in WQI over time, with the median WQI always in the 'poor' category. As this data is from only one site, extrapolation to the entire catchment may not be appropriate.
  - Time Trends analysis showed that three sites recorded a significant improvement in WQI over time (Nottingham at Candys Rd, Heathcote at Bowenvale Ave and Cashmere at Sutherlands Rd) and one site recorded a significant decline (Curletts at Motorway) (Table 4).

**Table 4.** Water Quality Index (WQI) scores at each site for the monitoring period of January to December 2019 and direction of significant trends ( $p \le 0.05$ ) since 2013. Additional water quality categories not represented by sites in 2019 are 'very poor' (0–39.99) and 'very good' ( $\ge$ 90).

Catchment	Site	WQI	Water Quality Category	Change over time
Ōpāwaho/ Heathcote	Curletts at Motorway	41.8	Poor	↓ 5%

# 4 Results: Wet Weather Monitoring

### 4.1 Styx River

#### 4.1.1 Rainfall

- The amount of rainfall that had fallen for the first and second wet weather event before samples were taken was 8 mm and 3 mm, respectively (Figure 15).
- Both sampling events therefore occurred during the First Flush (up 25 mm). Both rain events occurred after three dry days (where daily rainfall totals were less than 1 mm). However, the second event did not meet the criteria of a minimum of 5 mm total rainfall depth prior to sampling.
- The levels of parameters for the second event may therefore be lower than what typically occurs in waterways during wet weather.

**Figure 15.** Rainfall during the wet weather events of 3/09/2018 (blue line) and 4/09/2019 (purple line), with approximate sampling times indicated by dotted lines.

#### 4.1.2 Water Quality Parameters

- Parameter concentrations were generally similar between monitoring events (Figures 16– 20).
- The guidelines were not met for:
  - TSS at the Styx at Main North Rd and Styx at Marshlands Rd sites during the first event (recording a high value of 190 mg/L eight times higher than the guideline level)
  - Turbidity at all sites during the first event; levels were particularly high at the Styx at Marshlands Rd site, where a value of 57 NTU was recorded – 10 times higher than the guideline level
  - o Dissolved oxygen at Styx at Marshlands Rd during the first event

- o BOD₅ at the Styx at Marshlands Rd site during the first event
- NNN generally at all sites during both events
- DRP generally at all sites during both events
- E. coli all sites during the first event and at Kā Pūtahi at Belfast Rd site during the second event. No E. coli samples were associated with a recorded wastewater overflow event
- Levels were generally comparable to the monthly monitoring, with the following notable exceptions:
  - TSS levels during the first event at the Styx at Marshlands Rd site were much higher
  - o Turbidity at the Styx at Marshlands Rd site during the first event was much higher
  - o DO levels were higher at the Smacks at Gardiners Rd site during both events
  - o BOD<sub>5</sub> was generally higher at all sites during the first event
  - DRP at the Smacks at Gardiners Rd and Styx at Main North Rd sites were higher during the first event
  - o *E. coli* at Styx at Main North Rd during the first event

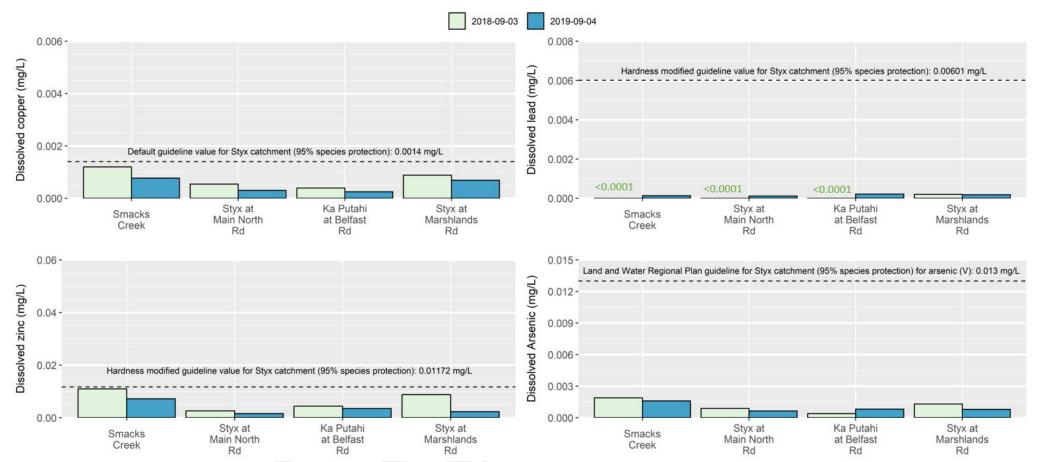

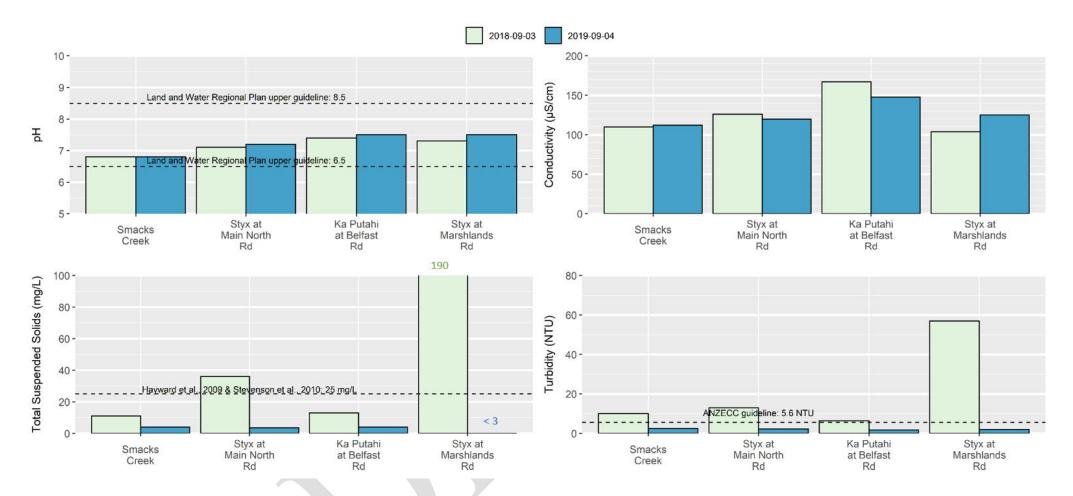

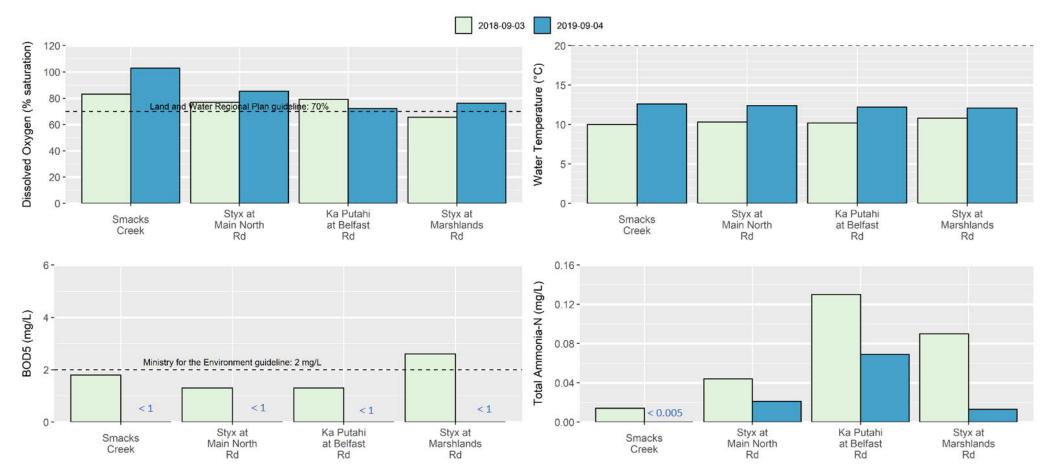

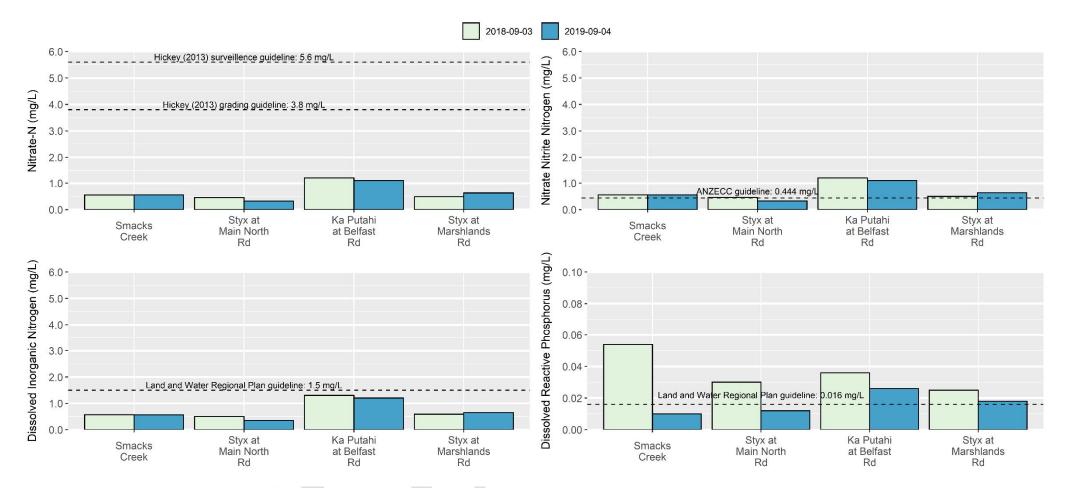

Figure 16. Dissolved copper (top left), lead (top right), zinc (bottom left) and arsenic (bottom right) levels in water samples taken from the Pūharakekenui/ Styx River catchment during two rain events. Sites are ordered from upstream to downstream (left to right). The dashed lines represent either the 95% default (copper, arsenic) or hardness modified (lead, zinc) guideline values as per the Land and Water Regional Plan (Environment Canterbury, 2019) and Warne *et al.*, (2018).

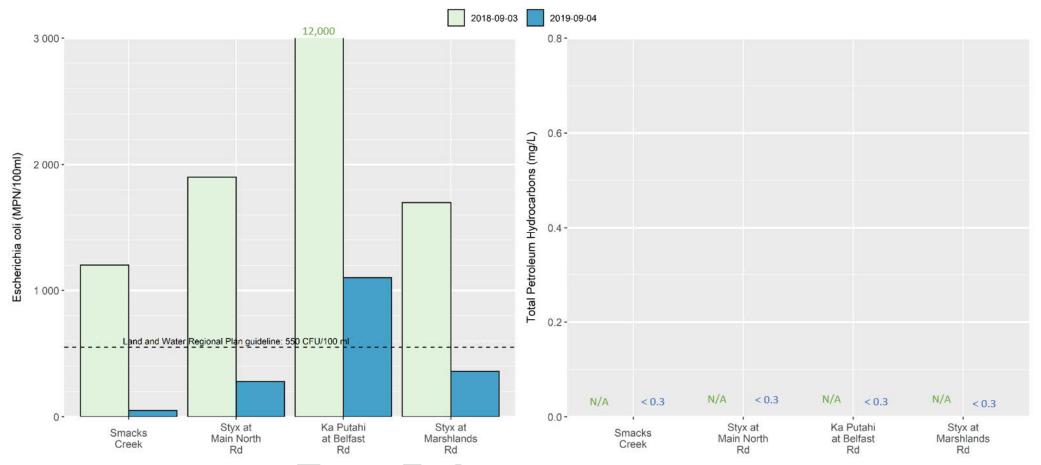

**Figure 17.** pH (top left), conductivity (top right), Total Suspended Solids (TSS; bottom left) and turbidity (bottom right) levels in water samples taken from the Pūharakekenui/ Styx River catchment during two rain events. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the respective guidelines (pH: Environment Canterbury (2017); TSS: Hayward *et al.* (2009) & Stevenson *et al.* (2010); Turbidity: ANZECC (2000)).

**Figure 18.** Dissolved oxygen (DO; top left), water temperature (top right), BOD<sub>5</sub> (bottom left) and total ammonia-N (bottom right) levels in water samples taken from the Pūharakekenui/ Styx River catchment during two rain events. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the respective guidelines (DO, water temperature: Environment Canterbury, 2019; BOD<sub>5</sub>: Ministry for the Environment, 1992). The guideline value for total ammonia-N, adjusted in accordance with median 2019 pH (7.2; Environment Canterbury, 2019), is not visible as it is off the scale (1.99 mg/L).

**Figure 19.** Nitrate-N (top left), Nitrate Nitrite Nitrogen (NNN; top right), Dissolved Inorganic Nitrogen (DIN; bottom left) and Dissolved Reactive Phosphorus (DRP) levels in water samples taken from the Pūharakekenui/ Styx River catchment during two rain events. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the respective guidelines (Nitrate-N: Hickey, 2013; NNN: ANZECC, 2000; DIN, DRP: Environment Canterbury, 2019).

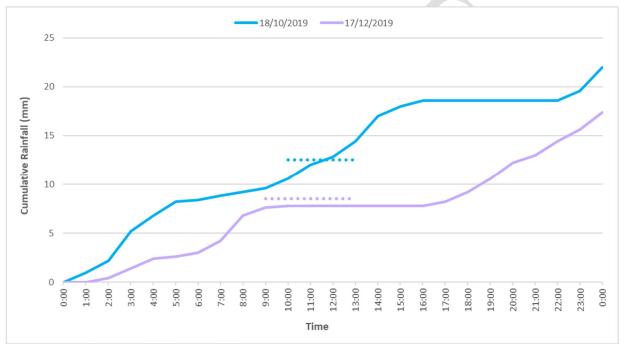

**Figure 20.** *Escherichia coli* (left) and Total Petroleum Hydrocarbons (TPH; right) levels in water samples taken from the Pūharakekenui/ Styx River catchment during two rain events. Sites are ordered from upstream to downstream (left to right). The dashed line represents the Land and Water Regional Plan guideline value of 550 MPN/100ml for 95% of samples for 'spring-fed – plains' waterways (Environment Canterbury, 2019).

### 4.2 Avon River

#### 4.2.1 Rainfall

- The amount of rainfall that had fallen for the first and second wet weather event before samples were taken was 11 mm and 8 mm, respectively (Figure 21).
- Both sampling events therefore occurred during the First Flush (up 25 mm).
- Prior to sampling the first event, approximately 2 mm of rain was recorded each day for the three days preceding sampling. The second rain event occurred after three dry days (where daily rainfall totals were less than 1 mm).
- Due to the first event not meeting the minimum antecedent dry period, levels may be lower than what typically occurs in waterways during wet weather.

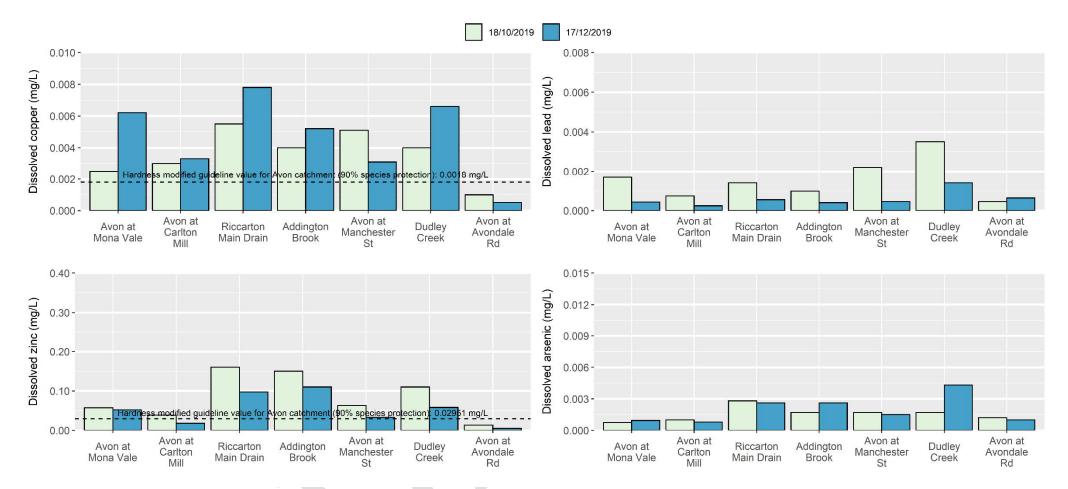

**Figure 21.** Rainfall during the wet weather events of 18/10/2019 (blue line) and 17/12/2019 (purple line), with approximate sampling times indicated by dotted lines.

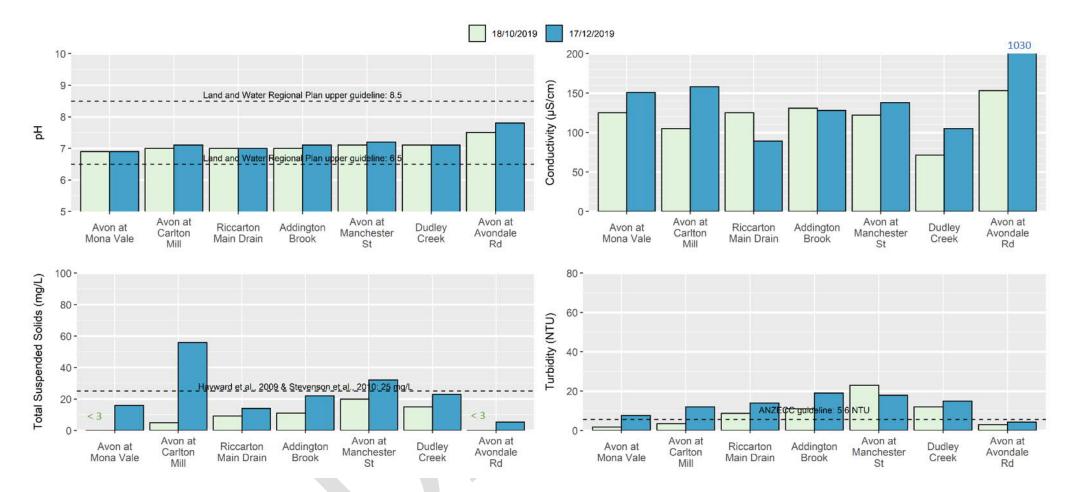

#### 4.2.2 Water Quality Parameters

- Parameter concentrations were usually similar between monitoring events, or higher during the second event, depending on the parameter (Figures 22–26).
- No one site typically recorded much higher levels compared to the other sites.
- The guidelines were not met for:
  - o Dissolved copper and zinc generally at all sites during both events
  - TSS at the Avon at Carlton Mill and Avon at Manchester St sites during the second event
  - Turbidity generally at all sites during both events
  - o Dissolved oxygen at Dudley Creek during the second event
  - o BOD<sub>5</sub> generally at all sites during both events
  - NNN generally at all sites during both events
  - o DIN at the Avon at Mona Vale site during the second event
  - DRP generally at all sites during both events
  - *E. coli* generally at all sites. No *E. coli* samples were associated with a recorded wastewater overflow event

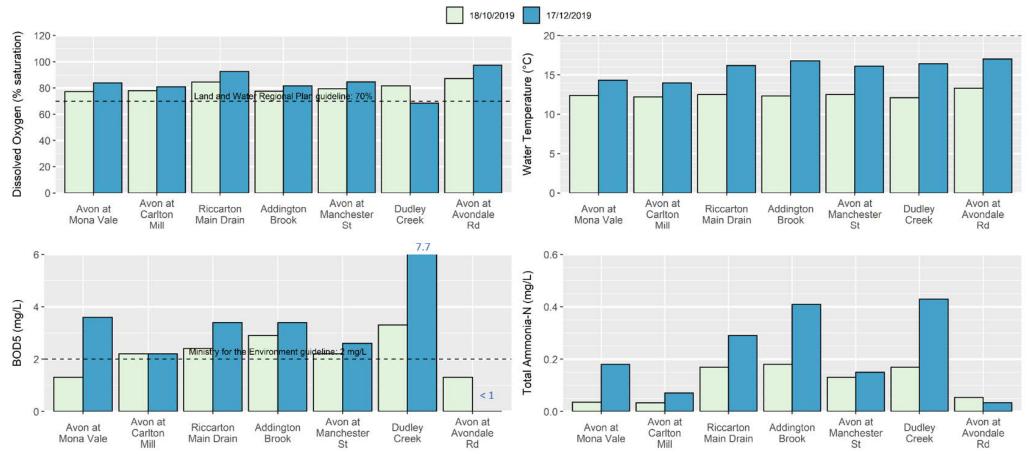

- Levels were generally comparable to that recorded during the monthly monitoring, with the following exceptions:
  - o Dissolved copper was generally higher during both events at all sites
  - Dissolved lead was higher during the first event at the Avon at Mona Vale, Avon at Manchester St and Dudley Creek sites
  - o TSS and turbidity levels were higher during both events at Avon at Manchester St
  - o BOD₅ was generally higher at all sites during both events
  - Total ammonia levels were higher during the second event at the Avon at Mona Vale, Riccarton Main Drain, Addington Brook and Dudley Creek sites
  - DRP levels were higher during the second event at the Avon at Mona Vale, Riccarton Main Drain and Addington Brook sites
  - *E. coli* levels were higher predominantly during the second event at the Avon at Mona Vale, Addington Brook, Avon at Manchester St, and Dudley Creek sites

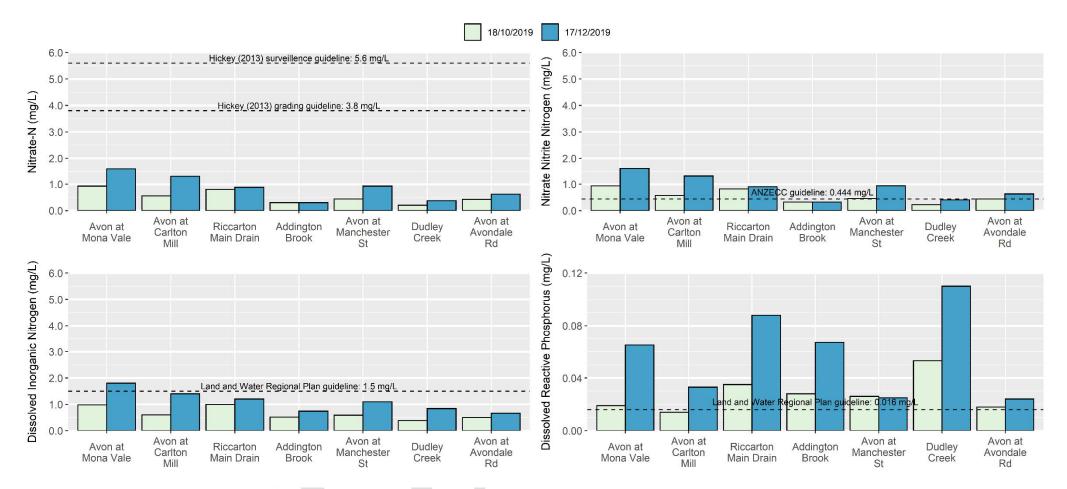

**Figure 22.** Dissolved copper (top left), lead (top right), zinc (bottom left) and arsenic (bottom right) levels in water samples taken from the Ōtākaro/ Avon River catchment during two rain events. Sites are ordered from upstream to downstream (left to right). The dashed lines represent either the 90% default (copper) or hardness modified (zinc) guideline values as per the Land and Water Regional Plan (Environment Canterbury, 2019) and Warne *et al.* (2018). The lead (hardness modified: 0.01539 mg/L) and arsenic (V) (default: 0.042 mg/L) guidelines are not visible as they are off the scale.

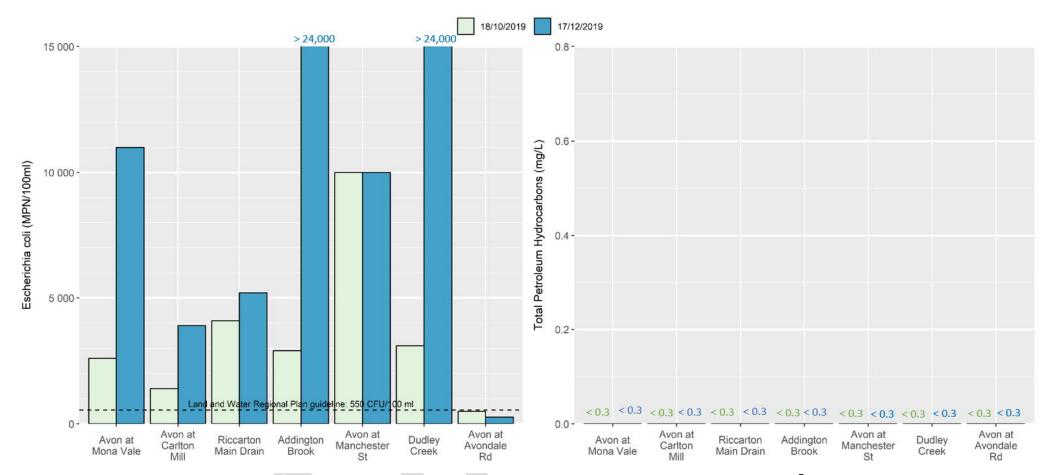

**Figure 23.** pH (top left), conductivity (top right), Total Suspended Solids (TSS; bottom left) and turbidity (bottom right) levels in water samples taken from the Ōtākaro/ Avon River catchment during two rain events. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the respective guidelines (pH: Environment Canterbury (2017); TSS: Hayward *et al.* (2009) & Stevenson *et al.* (2010); Turbidity: ANZECC (2000)).

**Figure 24.** Dissolved oxygen (DO; top left), water temperature (top right), BOD<sub>5</sub> (bottom left) and total ammonia-N (bottom right) levels in water samples taken from the Ōtākaro/ Avon River catchment during two rain events. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the respective guidelines (DO, water temperature: Environment Canterbury, 2019; BOD<sub>5</sub>: Ministry for the Environment, 1992). The guideline value for total ammonia-N, adjusted in accordance with median 2019 pH (7.3; Environment Canterbury, 2019) is not visible as it is off the scale (1.88 mg/L).

**Figure 25.** Nitrate-N (top left), Nitrate Nitrite Nitrogen (NNN; top right), Dissolved Inorganic Nitrogen (DIN; bottom left) and Dissolved Reactive Phosphorus (DRP) levels in water samples taken from the Ōtākaro/ Avon River catchment during two rain events. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the respective guidelines (Nitrate-N: Hickey, 2013; NNN: ANZECC, 2000; DIN, DRP: Environment Canterbury, 2019).

**Figure 26.** *Escherichia coli* (left) and Total Petroleum Hydrocarbons (TPH; right) levels in water samples taken from the Ōtākaro/ Avon River catchment during two rain events. Sites are ordered from upstream to downstream (left to right). The dashed line represents the Land and Water Regional Plan guideline value of 550 MPN/100ml for 95% of samples for 'spring-fed – plains – urban' waterways (Environment Canterbury, 2019).

## 5 Discussion

There were several parameters within the waterways that were recorded at levels unlikely to cause adverse effects, including dissolved lead, pH, water temperature, BOD<sub>5</sub>, and total ammonia. However, 20% of samples (1,463 of 7,440 samples) did not meet the guideline levels. The parameters that recorded values well outside the guidelines across most sites included dissolved copper, dissolved zinc, NNN, DIN, DRP, and *E. coli*. There were also some parameters that generally recorded levels within the guidelines, but on several occasions, or regularly at a small number of sites, levels exceeded the guidelines. These parameters were TSS, turbidity, dissolved oxygen, and nitrate. The parameters that did not meet guidelines at the most sites were *E. coli* (36 sites), NNN (32 sites), and DRP and dissolved copper (both 23 sites).

The concentrations of parameters at the sites have mostly remained steady over time (64%), but some improvements in water quality were recorded this year (28%) and some declines (8%). The following temporal trends of note were recorded:

- A small decrease in BOD<sub>5</sub>, DRP and NNN/DIN, across all catchments.
- An increase in *E. coli* levels at many sites in the Pūharakekenui/ Styx River.
- An increase in nitrogen at the Ōtūkaikino at Scout Camp site. This indicates that there are still some nutrient sources entering the stream, likely due to agricultural land use in the catchment.
- An increase in dissolved copper and zinc at the Curletts at Motorway site and a decrease in nitrogen. An increase in copper and zinc over time is not unusual, especially in an industrial catchment like this, due to increases in traffic volumes (with copper coming from brake pads and zinc from tyres) and degradation of roofs with zinc over time. This is supported by the increase in zinc being due to a gradual change in concentrations over time, rather than sudden peaks in concentrations. This was the first year of monitoring that there was a significant increase in copper at this site. The reason for the decrease in nitrogen is unclear, but may be due to riparian planting that has been carried out by the CCC upstream of the Motorway (due to filtering of runoff from adjacent grassed areas), less input from nitrogen rich groundwater, or more stormwater inputs diluting groundwater.
- Reductions in copper and lead at the Curletts U/S of Heathcote site. The steady decrease in copper may be due to reductions in the source of this contaminant (predominantly brake pads), due to the building of the motorway with related stormwater treatment. However, monitoring began after the motorway construction, so there is no before data for comparison. The reduction in lead may be due to a decrease over time due to the phasing out of leaded petrol.
- A steady increase in ammonia over time within Wilsons Drain, with more peaks in later years. This catchment drains the industrial area of Belfast, so this indicates that ammonia has been reaching the stormwater system from some businesses for some time, with overall concentrations slowly increasing.
- A decrease in DRP at the Cashmere Stream at Sutherlands Rd site, due to a reduction in large peaks since 2014. This is likely due to the gradual urbanisation for this traditionally agricultural catchment (i.e reducing runoff and erosion).
- Reductions in the concentrations of a number of parameters at the Halswell Basin outlet, including dissolved copper, dissolved lead, TSS, ammonia, BOD<sub>5</sub>, DIN and DRP. There was a small reduction in TSS recorded over time at the inlet also, so the large reduction of TSS at the outlet may be a combination of less inputs into the basin and increased treatment efficiency over time for the basin. No alterations have been made to the basin since its construction; however, increased efficiency may

have occurred through the maturation of vegetation around the basin. The reduction in copper and lead at the outlet may be due to the increased TSS removal efficiency, as a proportion of metals adsorb to sediment and there were no significant reductions in these contaminants at the inlet. As there was a large decrease in ammonia at the inlet, and the basin is a wet pond not likely to treat these contaminants, it may be that inputs into the catchment of this parameter have reduced overall. As ammonia makes up a proportion of DIN, it is likely the reduction in DIN at both the inlet and outlet is due to the reduction in ammonia, with trends between the two parameters also similar over time. In contrast, the reductions in ammonia and DIN may be related to less waterfowl inputs over time, again due to the maturing of vegetation preventing access to the pond. This would also explain the reduction in  $BOD_5$  (at both the inlet and outlet), DRP (at both the inlet and outlet), E. coli at the inlet and ammonia at the inlet as well as the outlet. Even though it was expected that lead inputs would have reduced over time since the phasing out of leaded petrol, this parameter still occurs within the basin, with the highest level recorded this monitoring year since monitoring began in 2014. This may indicate an industrial source within the catchment.

The results of the temporal trends do not indicate that there have been any lasting effects on sediment levels in the water at these monitoring sites due to (1) the 2010 Christchurch earthquake sequence, or (2) the 2017 Port Hills fires and subsequent erosion. However, TSS and turbidity may be trending towards a significant increase over time at Cashmere at Worsleys Rd, and this should be assessed in next year's report. In addition, sediment cover and depth of the streambed may have increased due to these two events, and this is not covered by this water quality monitoring programme but addressed by other aquatic ecology monitoring undertaken by the CCC.

In 2019, major instream projects such as dredging and bank stabilisation occurred in the Ōpāwaho/ Heathcote River. Separate monitoring for these projects showed that high TSS and turbidity levels occurred due to the dredging works. In this monitoring, much higher conductivities were recorded at the three lower Ōpāwaho/ Heathcote River sites this year, compared to last year, and this is likely to be due to the dredging. Atypically high dissolved lead levels were also recorded at these sites during the latter part of the year, with sample collection coinciding with periods of dredging. However, these increases did not result in any significant change in parameters since monitoring began, with the exception of conductivity at the Heathcote at Catherine St site.

Based on the WQI, the Ōtūkaikino and Pūharakekenui/ Styx River catchments generally had 'good' water quality; however, all other catchments generally had 'poor' water quality. The Ōtūkaikino River recorded the best overall water quality out of all the catchments, but the best site was shared between the Ōtūkaikino at Scout Camp and Styx at Main North Rd sites, followed by the Ōtūkaikino River at Groynes site, and then the Smacks at Gardiners Rd site. The catchment recording the worst water quality was Ōpāwaho/ Heathcote River. The worst sites were in this catchment, at the Curletts at Motorway, then Heathcote at Tunnel Rd, followed jointly by Haytons Stm and Heathcote at Ferrymead Bridge sites. There were a number of contaminants of particular concern at the Curletts at Motorway (copper, zinc, DO, DRP, *E. coli*), Heathcote at Tunnel Rd (TSS, turbidity, NNN, DRP), Haytons Stm (copper, zinc, turbidity, DRP) and Heathcote at Ferrymead Bridge (TSS, turbidity, NNN, DRP) sites.

Most catchments showed improvement in the WQI compared to 2018, with seven sites in the 'good' category, up from zero in 2018. Improvement of these seven sites is largely due to a decrease in the number of parameters exceeding the guideline, particularly for

pH and DRP, but also copper, zinc, TSS, DO, temperature,  $BOD_5$ , and *E. coli*. Differences in rainfall alone cannot explain the reduced number of exceedances observed this year. Compared to 2018, the number of rainfall events varied by only  $\pm 1$ . Significant increases in WQI scores over time were recorded at Nottingham at Candys Rd, Heathcote at Bowenvale Ave and Cashmere at Sutherlands Rd. However, the Curletts at Motorway site WQI significantly declined over time.

The six waterway sites located in proximity to main stormwater outfalls did not appear to record differing results compared to the other waterway sites. This could be due to (a) many of the other sites also being located near other outfalls, (b) the monthly monitoring not often being carried out during the early stages of a wet weather event (when the 'first flush' of contaminants typically occurs), or (c) stormwater not having any noticeable effects in these locations. The exception to this was Curletts at Motorway, which generally recorded worse levels of contaminants than other waterway sites (for copper, zinc, pH, dissolved oxygen, BOD<sub>5</sub> and DRP). Haytons Stm also recorded higher levels of copper, zinc, pH, BOD<sub>5</sub>, and DRP compared to the other waterway sites, as Avon at Mona Vale did occasionally for TSS.

The two Halswell Basin sites (inlet and outlet) generally recorded higher concentrations of parameters than the waterway sites. In particular, the basin recorded higher levels of copper, zinc, pH, TSS, BOD<sub>5</sub>, and total ammonia. This is to be expected given the predominantly industrial stormwater input into the basins and that the waterways are subjected to dilution from baseflow. The outlet generally recorded lower levels than the inlet. Lower levels at the outlet might be due to the treatment ability of the basin, but as these samples were taken at the same time, it may be a reflection that peak contaminant levels had not reached the outlet levels were elevated, and it was thought that basin processes were causing basic conditions. This years' results indicate that there may be processes higher in the catchment creating the basic conditions. Overall, these monitoring results for the basin are similar to those recorded in previous years (e.g. Margetts & Marshall, 2015; Margetts & Marshall, 2016; Margetts & Marshall, 2018; Marshall & Burrell, 2017; Marshall & Noakes, 2019).

Wet weather monitoring in the  $\overline{O}t\overline{a}karo/Avon and P\overline{u}harakekenui/Styx River catchments was generally similar to the monthly monitoring. However, there were a number of exceptions for many parameters across many sites. The most widespread exceptions were higher levels in the wet weather monitoring for BOD<sub>5</sub> in both catchments and higher copper levels in the <math>\overline{O}t\overline{a}karo/Avon$  River catchment. As the main source of copper is from brake pads, these higher concentrations than the monthly monitoring are likely due to stormwater input from roads and carparks.

The results of this year's monitoring are largely consistent with those recorded in previous years (Dewson, 2012; Dewson, 2013; Whyte, 2013a; Whyte, 2013b; Whyte, 2014a; Whyte, 2014b; Margetts, 2014a; Margetts & Marshall, 2015; Margetts & Marshall, 2016, Marshall & Burrell, 2017; Margetts & Marshall, 2018, Marshall & Noakes, 2019). This indicates that many of Christchurch's waterways are both historically and currently subjected to contamination, from stormwater, wastewater and other inputs (e.g. agriculture, waterfowl faeces and industrial discharges). These parameters may be having short-term and long-term adverse effects on biota (i.e. DIN, copper, zinc, TSS/turbidity, dissolved oxygen and BOD<sub>5</sub>), may encourage the proliferation of aquatic plants and/or algae (i.e. NNN and DRP), may indicate human health risks from contact recreation (i.e. *E. coli*) and may affect water clarity/aesthetics (TSS/turbidity). These results support the international Urban Stream Syndrome (Walsh *et al.*, 2005), whereby

lower water quality is recorded internationally in urban (particularly industrial) areas (e.g. Ōtākaro/ Avon and Ōpāwaho/ Heathcote River catchments) and generally better water quality is recorded in rural areas (e.g. Ōtūkaikino River catchment).

The sites and parameters of concern in this report should be the focus of improved catchment management practices by CCC, ECan and landowners themselves. The CCC has recently been granted a new stormwater consent for the City and Banks Peninsula, the Comprehensive Stormwater Network Discharge Consent (CSNDC). This consent will give the Council better focus and directive to tackle surface water quality issues within its jurisdiction. Past, current and future practices to improve stormwater quality include source control (e.g., erosion and sediment control measures, redirection of stormwater to trade waste), more effective stormwater treatment devices and community education. For example, CCC are constructing a number of stormwater basins for the purpose of flood mitigation and stormwater treatment. CCC also work with ECan to audit business in key catchments, helping reduce the amount of contaminants entering the stormwater system. Implementation of new regional and national policy will also support these measures. Due to all this, surface water quality improvements are anticipated across the City, but may only occur over long time scales, due to the size of the issue and the lag in benefits. Further monitoring and targeted management is still required to address the water quality issues detailed in this report.

## 6 Recommendations

- Haytons Stream and Curletts Road Stream should remain as the top priority areas for improved contaminant source control and stormwater treatment, followed by the middle tributaries of the Ōtākaro/ Avon River (Riccarton Main Drain, Addington Brook and Dudley Creek):
  - CCC and ECan should continue working with landowners to reduce contaminants entering stormwater systems or waterways directly. Industrial site audits are proving a good avenue for targeting key contaminant sources and increasing education around stormwater.
  - CCC should undertake detailed effectiveness monitoring of the two stormwater treatment facilities recently upgraded in Haytons and Curletts Streams (Haytons Retention Basin and Wigram Basin). Monitoring of Wigram basin is currently proposed within the stormwater device efficiency monitoring project of the CSNDC, in conjunction with ECan and the University of Canterbury.
  - Haytons and Curletts Road Streams should remain the priority for the targeted wet weather monitoring project under the CSNDC, which aims to pin point hotspots of contaminants within these catchments, to inform catchment management practices. With time and if resources allow, the project should extend to the Ōtākaro/ Avon River tributaries.
  - The recommendations within the ECan catchment management plan for Addington Brook and the Haytons Stream Action Plan should be undertaken.
  - Stormwater treatment by the large CCC facilities proposed for Addington Brook and Riccarton Stream should be prioritised.
- Investigations into the sources of particularly poor water quality in non-priority catchments should be carried out for the following waterways, based on this and previous year's results:
  - Linwood Canal (DO, total ammonia, DRP, and *E. coli*).
  - Wilsons Stream (ammonia, nitrogen, and *E. coli*)
  - Cashmere at Worsleys Rd (TSS/turbidity). This is particularly important given the high concentration of threatened kākahi/freshwater mussels located in

Cashmere Stream (Instream Consulting Ltd, 2020; Marshall 2019, *unpublished data*).

- Heathcote at Templetons Road and Knights Stream (nitrogen)
- Kā Pūtahi Creek and other sites within the Pūharakekenui/ Styx River catchment, and Nottingham Stream (*E. coli*)
- Ōtūkaikino River at Scout Camp (NNN), although this may be due to the short monitoring period (approximately five years), compared to the other sites, with the significant annual increase decreasing each year (46% in 2017, 25% in 2018, and 18% in 2019).
- Investigations into the sources of phosphorus in the catchments should be carried out to identify the major source that is increasing downstream (e.g. fertilisers or faecal input).
- A long-term monitoring program is established to investigate changes in conductivity and salinity in the lower Ōpāwaho/ Heathcote River in response to dredging, and any resultant changes in biota and riparian vegetation.
- Investigations should be carried out to identify how best to reduce faecal contamination within the waterways, particularly with the public interest in swimmable rivers. Faecal source tracking has indicated that waterfowl are a major source of faecal contamination during dry and wet weather (Moriarty & Gilpin, 2015), but waterfowl control within the city may be unpopular with some people.
- Monitoring of Halswell Retention Basin is retained under the CSNDC stormwater device efficiency monitoring project, as it is no longer to be monitored under this surface water quality programme. This monitoring should include investigations into the high pH typically recorded in the basin.
- A Waterways Action Plan should be developed that considers collectively what we want to achieve for our waterways (this may vary between different people) and what is required to get there. For example, an improvement in stormwater quality may not result in an increase in biodiversity, due to other habitat limitations.

# 7 Conclusions

Christchurch City waterways generally recorded a WQI of 'poor' this monitoring year. The Ōpāwaho/ Heathcote River catchment recorded the poorest water quality, and the worst site was Curletts at Motorway, followed by Heathcote at Tunnel Rd, Haytons Stm and Heathcote at Ferrymead Bridge. The Ōtūkaikino River catchment recorded the best water quality and the best site was shared between the Ōtūkaikino at Scout Camp and Styx at Main North Rd sites. WQI largely did not change over time. The contaminants that exceeded guidelines at the most sites were *E. coli*, nitrogen, phosphorus and dissolved copper. The concentrations of all parameters have mostly remained steady over time, with some improvements and declines in water quality. The results of this year's monitoring are largely consistent with previous years.

## 8 Acknowledgements

CCC laboratory staff collected the monthly monitoring samples. Dr James Ross (Lincoln University), Ian Jowett (Jowett Consulting), Dr Amy Whitehead (NIWA) and Dr Jennifer Gadd (NIWA) provided invaluable advice on statistical modelling. Peter Christensen provided helpful comments on the draft report.

# **Appendix B: Metal Hardness Modified Guideline Values**

## Hardness Modified Guideline Values for Metals in Christchurch City Waterways

#### 1. Introduction

The Australian and New Zealand guidelines for fresh and marine water quality provide a set of default guideline values for dissolved metals (ANZG, 2018). If measured concentrations of toxicants are below the default guideline values, then there is a low risk of adverse environmental effects.

The guidelines also provide a process of modifying the default guideline values for local environmental conditions, namely hardness, which can affect the toxicity of metals (excluding copper) and therefore increase the risk of adverse biological effects (Warne et al., 2018). The default guideline values for metals assume that water is soft (hardness 0–59 mg/L as CaCO<sub>3</sub>). However, as water hardness increases, the toxicity of some metals decreases and therefore the guideline value may increase, without increasing the risk of adverse biological effects.

Hardness Modified Guideline Values (HMGV), formerly known as Hardness Modified Trigger Values (HMTV), have been previously calculated by Christchurch City Council (Dewson, 2012; Margetts & Marshall, 2015). It is considered that hardness values are unlikely to change over the years, so these values can be reassessed approximately every five years. This memorandum constitutes the five-yearly update of these values, as required under the Comprehensive Stormwater Network Discharge Consent (CRC190445), and reflects the recommendation that copper is no longer modified by hardness (Warne *et al.*, 2018).

#### 2. Methods

In 2019, water samples were collected monthly from 36 non-tidal sites across the five main river catchments within Christchurch City (Avon, Heathcote, Styx, Ōtūkaikino and Halswell Rivers), as well as a tidal site within Linwood Canal, giving a total of 12 samples for each of the 37 sites (Appendix A, Tables i and ii). These samples were collected as part of the wider Christchurch City Council surface water quality monitoring programme. Tidal sites within this wider monitoring programme for the five main river catchments<sup>1</sup> were excluded from the analyses, as tidal sites typically have high hardness levels, which would skew the results for each catchment, resulting in inappropriately higher guideline levels. As there was only one site for Linwood Canal, it did not matter that this site was tidal.

Boxplots of the water hardness data were created in RStudio (version 1.2.5033), to show the median and interquartile range. The dark line in the boxplots represents the median, and the bottom and top lines of the box represent the 25<sup>th</sup> and 75<sup>th</sup> percentiles (the interquartile range), respectively. The T-bars that extend from the box approximate the location of the 5<sup>th</sup> and 95<sup>th</sup> percentiles (using HAZEN methodology).

To calculate the HMGV, the following species protection levels were chosen, as per ECan (2018).

- Avon River, Heathcote River, and Linwood Canal catchments: 90% (Spring-fed plains – urban)
- Styx, Ōtūkaikino, and Halswell River catchments: 95% (Spring-fed plains)
- Cashmere Stream: 99% (Banks Peninsula)

<sup>&</sup>lt;sup>1</sup> Avon River at Pages/Seaview Bridge, Avon River at Bridge Street, Heathcote River at Catherine Street, Heathcote River at Tunnel Road and Heathcote River at Ferrymead Bridge.

These default guideline values were then modified by the median catchment hardness, as per the below formula (Warne *et al.*, 2018).

Lead HMGV = Default Guideline Value 
$$x \left(\frac{hardness}{30}\right)^{1.27}$$

 $Zinc HMGV = Default Guideline Value x \left(\frac{hardness}{30}\right)^{0.85}$ 

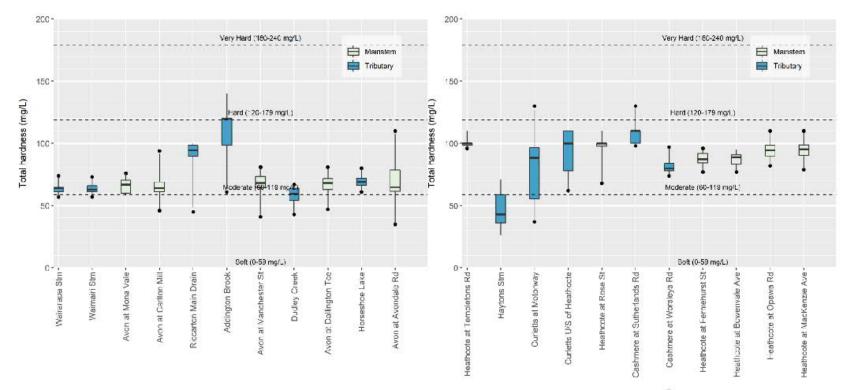

#### 3. Results

Median water hardness in the five main river catchments in Christchurch (Avon, Heathcote, Styx, Ōtūkaikino and Halswell) ranged from 'soft' to 'moderate'; however, Linwood Canal fell between the 'very hard' and 'extremely hard' categories (Table 1; Figures 1–2). HMGV are greater than default guideline values in each of the rivers in Christchurch, as the default values assume water is 'soft' and thus conservatively protects aquatic ecosystems (Table 1).

Table 1. Default and HMGV for dissolved zinc and lead in Christchurch waterways.

	Median	Species	Zinc gi	uideline	Lead g	uideline	
Catchment	hardness (mg/L)	protection level (ECan, 2018)	Default (mg/L)	HMGV (mg/L)	Default (mg/L)	HMGV (mg/L)	
Heathcote River – Cashmere Stream	94.0	99%	0.0024	0.00634	0.0010	0.00427	
Halswell River	75.0	95%	0.0080	0.01743	0.0034	0.01089	
Styx River	47.0	95%	0.0080	0.01172	0.0034	0.00601	
Ōtūkaikino River	35.0	95%	0.0080	0.00912	0.0034	0.00414	
Avon River	66.5	90%	0.0150	0.02951	0.0056	0.01539	
Heathcote River – remainder	94.0	90%	0.0150	0.03960	0.0056	0.02388	
Linwood Canal	370.0	90%	0.0150	0.12691	0.0056	0.13610	

**Figure 1.** Total hardness (as CaCO<sub>3</sub>) levels in water samples taken monthly from non-tidal sites within the Ōtākaro/Avon (left graph) and Ōpāwaho/Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June, as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the ANZECC (2000) delineations between water hardness categories.

**Figure 2.** Total hardness (as CaCO<sub>3</sub>) levels in water samples taken monthly from not-tidal sites within the Pūharakekenui/Styx and Ōtūkaikino Rivers (left graph), and the Huritini/Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the ANZECC (2000) delineations between water hardness categories.

# **Appendix E: Monthly Monitoring Graphs**

Figure i (a). Dissolved copper levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan

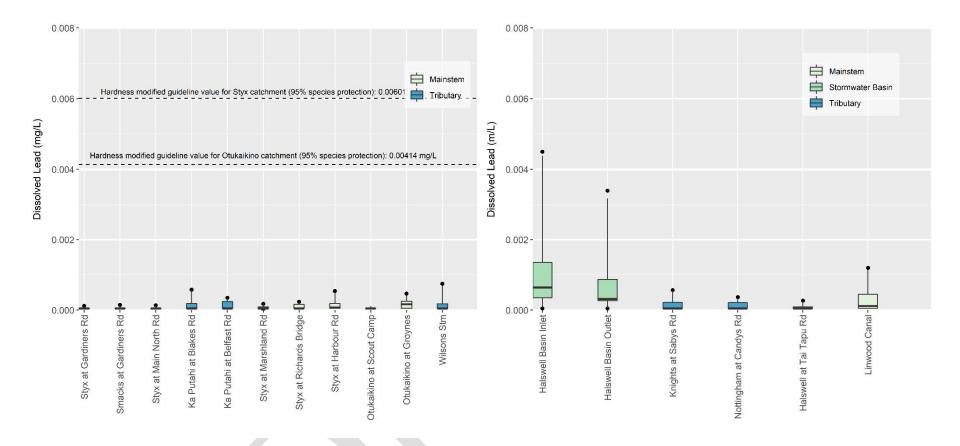

guideline values (Environment Canterbury, 2019). The Laboratory Limit of Detection for these two catchments was 0.0001 mg/L – analysed as half this value (0.00005 mg/L) to allow statistics to be undertaken.

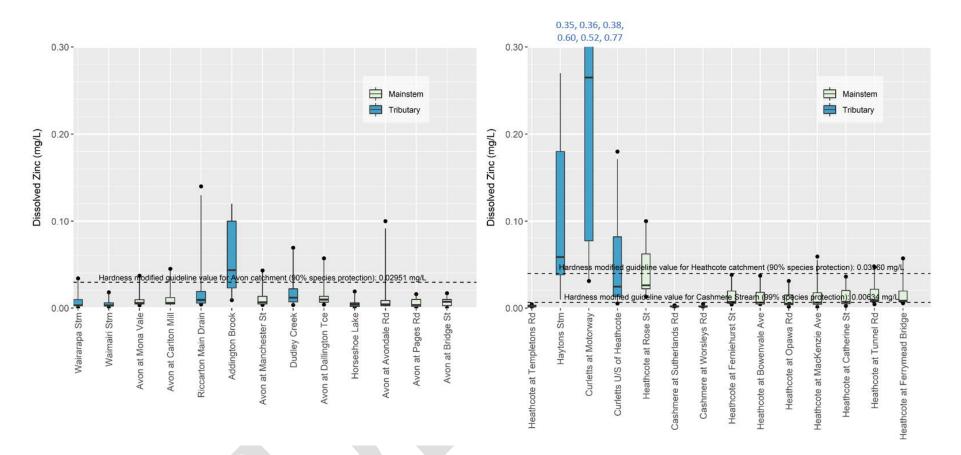

**Figure i (b).** Dissolved copper levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan guideline values (Environment Canterbury, 2019). The 90% species protection HMGV for Linwood Canal (0.167 mg/L) is not visible because it is off the scale. The Laboratory Limit of Detection was 0.0001 mg/L (analysed as half this value (0.00005 mg/L) to allow statistics to be undertaken).

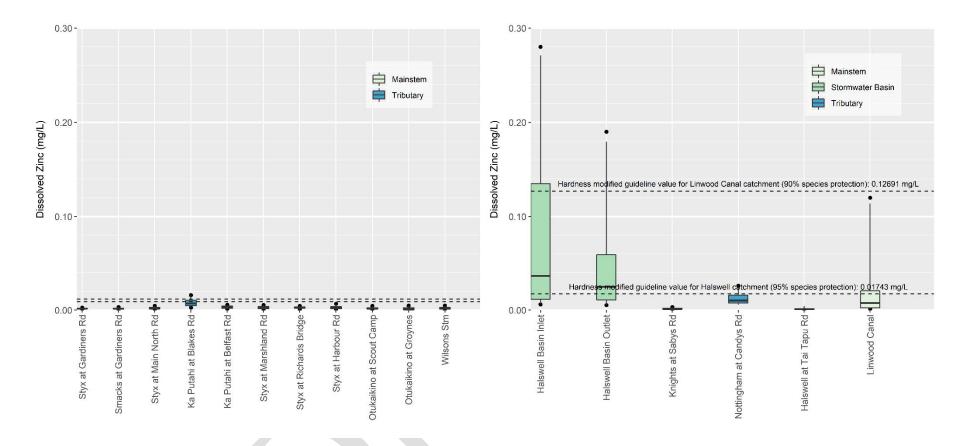

**Figure ii (a).** Dissolved lead levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed line represents the Land and Water Regional Plan guideline value (Environment Canterbury, 2019), which has been modified to account for water hardness (Hardness Modified Guideline Value = HMGV), as per the Warne *et al.* (2018) guidelines methodology. The 90% protection HMGV for the Ōtākaro/ Avon River (0.01539 mg/L) and the Ōpāwaho/ Heathcote River (0.02388 mg/L) are not shown as they are off the scale. The Laboratory Limit of Detection was 0.0001 mg/L – analysed as half this value (0.00005 mg/L) to allow statistics to be undertaken.

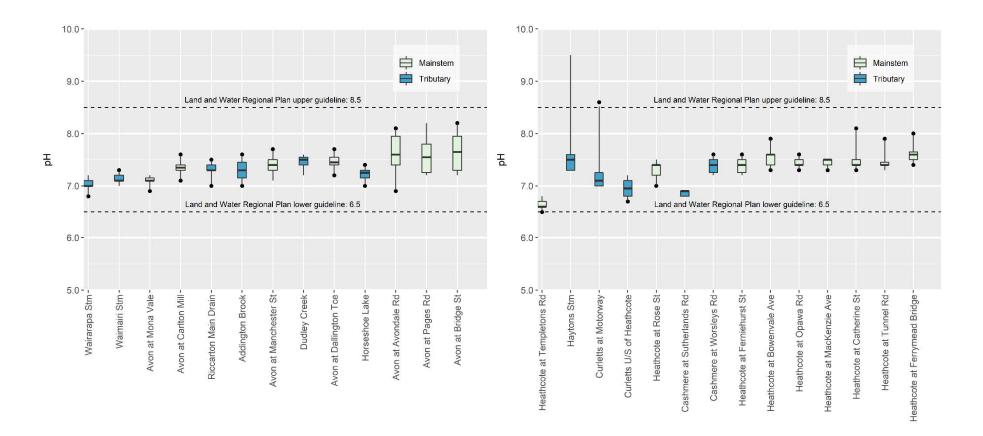

**Figure ii (b)**. Dissolved lead levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan guideline value (Environment Canterbury, 2019), which has been modified to account for water hardness (Hardness Modified Guideline Value = HMGV), as per the Warne *et al.* (2018) guidelines methodology. The 95% protection HMGV for Huritini/ Halswell River (0.01089 mg/L) and 90% protection HMGV for Linwood Canal (0.13610 mg/L) are not visible because they are off the scale. The Laboratory Limit of Detection was 0.0001 mg/L – analysed as half this value (0.00005 mg/L) to allow statistics to be undertaken.

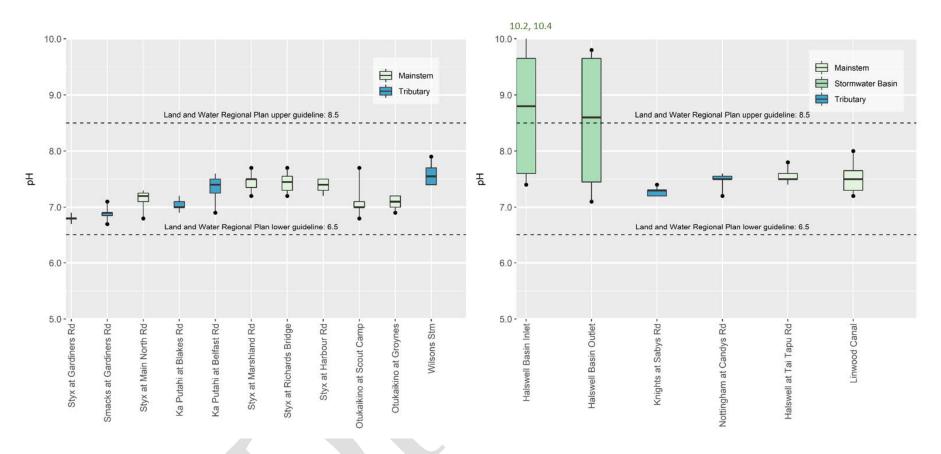

**Figure iii (a).** Dissolved zinc levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan guideline values (Environment Canterbury, 2019), which have been modified to account for water hardness (Hardness Modified Guideline Value = HMGV), as per the Warne *et al.* (2018) guidelines methodology. The Laboratory Limit of Detection was 0.0001 mg/L – analysed as half this value (0.00005 mg/L) to allow statistics to be undertaken.

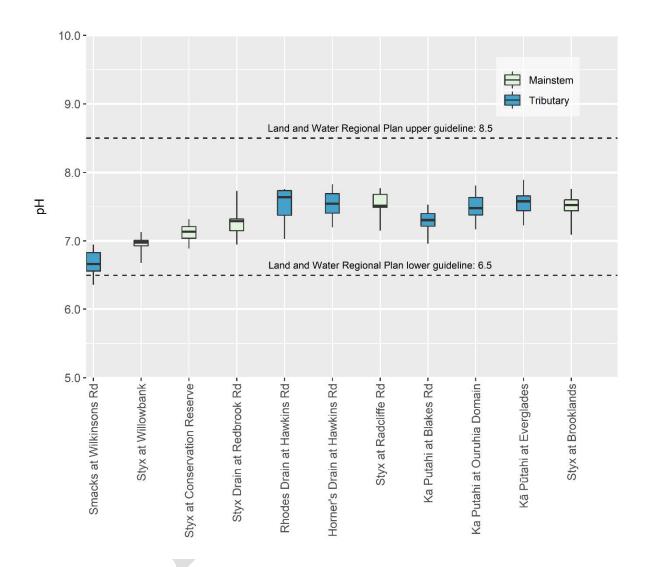

**Figure iii (b)**. Dissolved zinc levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan guideline values (Environment Canterbury, 2019), which have been modified to account for water hardness (Hardness Modified Guideline Value = HMGV), as per the Warne *et al.* (2018) guidelines methodology. On the left graph, the upper dashed line represents the 95% species protection for Pūharakekenui/ Styx River catchment (0.01172 mg/L), while the lower represents the 95% species protection for Ōtūkaikino River catchment (0.00912 mg/L). The 90% protection HMGV for Linwood Canal (0.12691 mg/L) is not visible because it is off the scale. The Laboratory Limit of Detection was 0.0001 mg/L – analysed as half this value (0.00005 mg/L) to allow statistics to be undertaken.

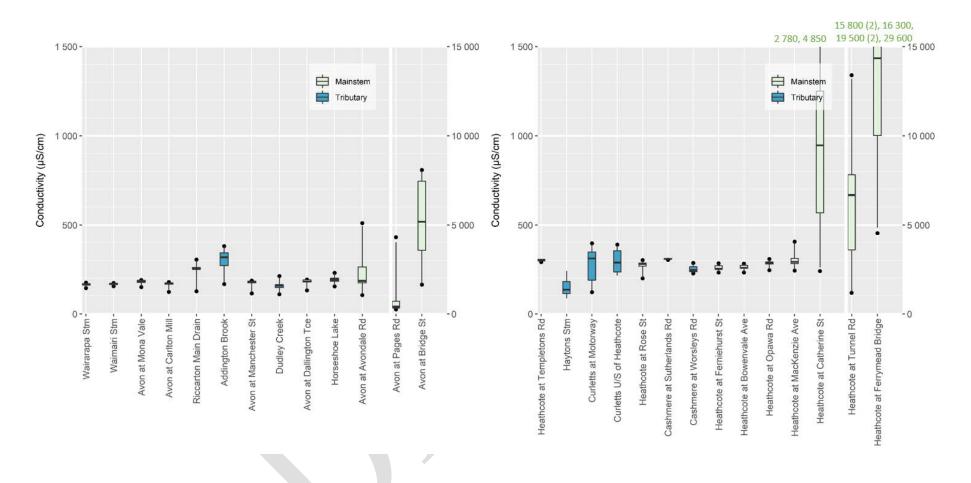

**Figure iv (a).** pH levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019.No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan lower (6.5) and upper (8.5) limits (Environment Canterbury, 2019).

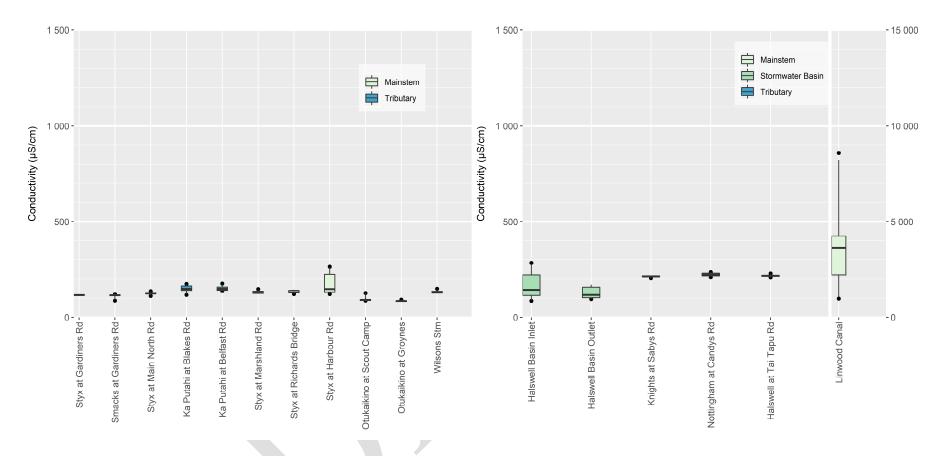

**Figure iv (b).** pH levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan lower (6.5) and upper (8.5) limits (Environment Canterbury, 2019).

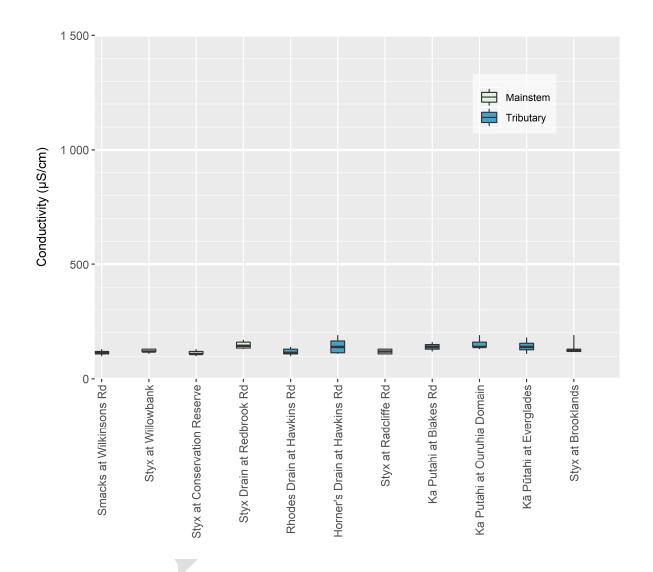

**Figure iv (c)**. pH levels in water samples taken from the Pūharakekenui/ Styx River catchment by the Styx Living Laboratory Trust volunteers for the monitoring period January to December 2019 (n = 6-10 samples per site). Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan lower (6.5) and upper (8.5) limits (Environment Canterbury, 2019).

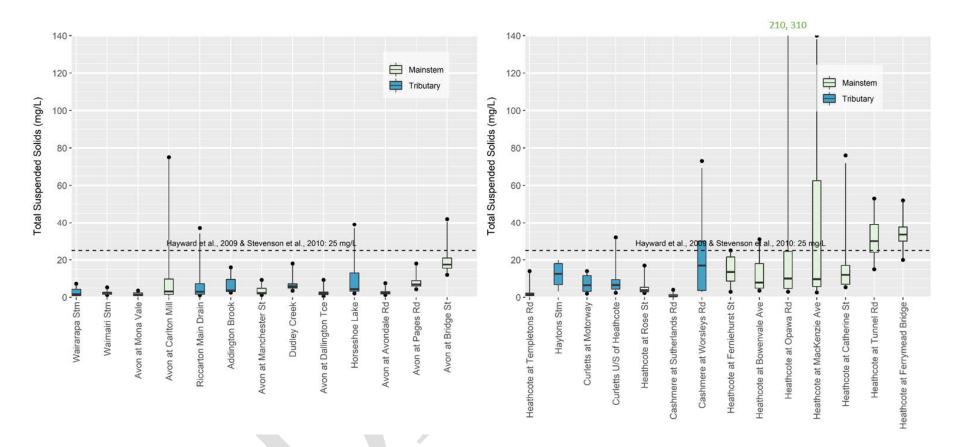

**Figure v (a).** Conductivity levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019.No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). All conductivity graphs have the same scale presented on the primary (left) axis. Given the large differences in values within the catchments, some sites are presented with an alternate scale on the secondary (right) axis. Scale change is marked with a vertical, thick white line.

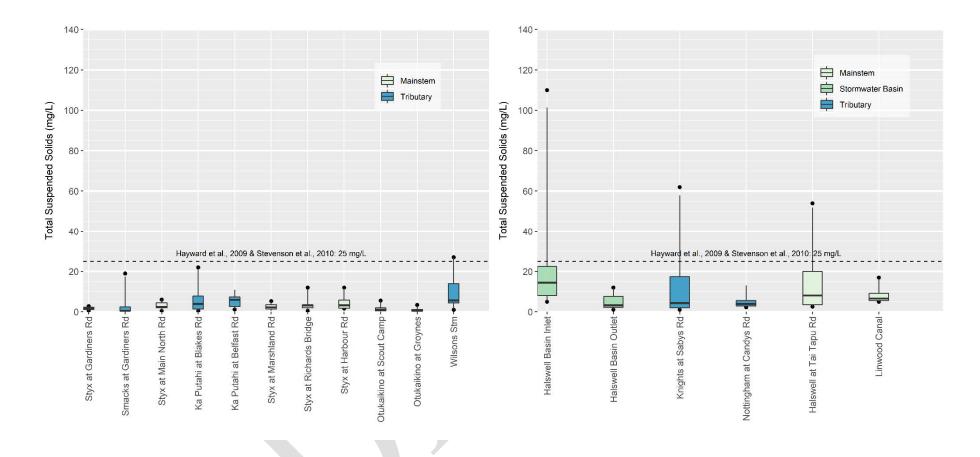

**Figure v (b).** Conductivity levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). All conductivity graphs have the same scale presented on the primary (left) axis. Given the large differences in values within the catchments, some sites are presented with an alternate scale on the secondary (right) axis. Scale change is marked with a vertical, thick white line.

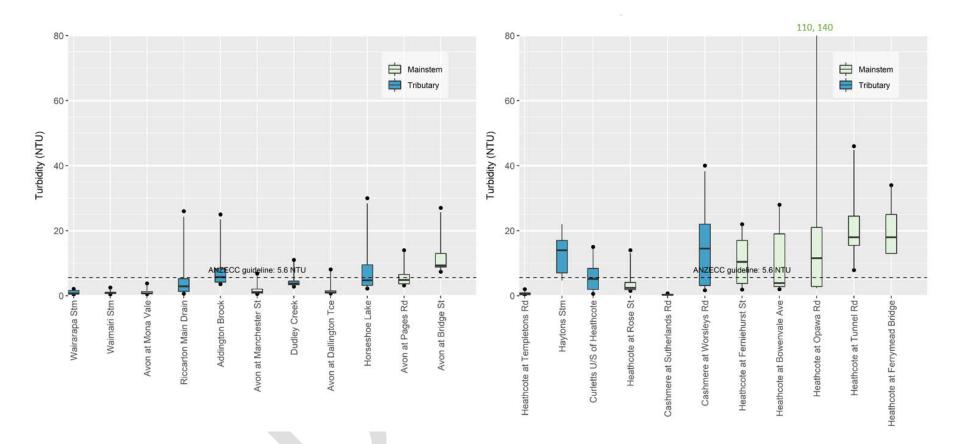

**Figure v (c).** Conductivity levels in water samples taken from the Pūharakekenui/ Styx River catchment by the Styx Living Laboratory Trust volunteers for the monitoring period January to December 2019 (n = 6-10 samples per site). Sites are ordered from upstream to downstream (left to right).

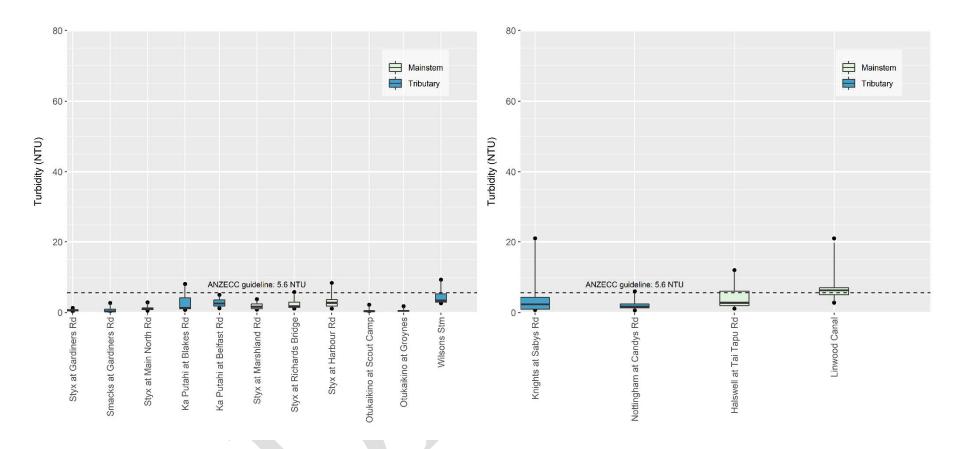

**Figure vi (a)**. Total Suspended Solid (TSS) levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the guideline value of 25 mg/L. The Laboratory Limit of Detection was 1.0 mg/L – analysed as half this value (0.5 mg/L) to allow statistics to be undertaken.

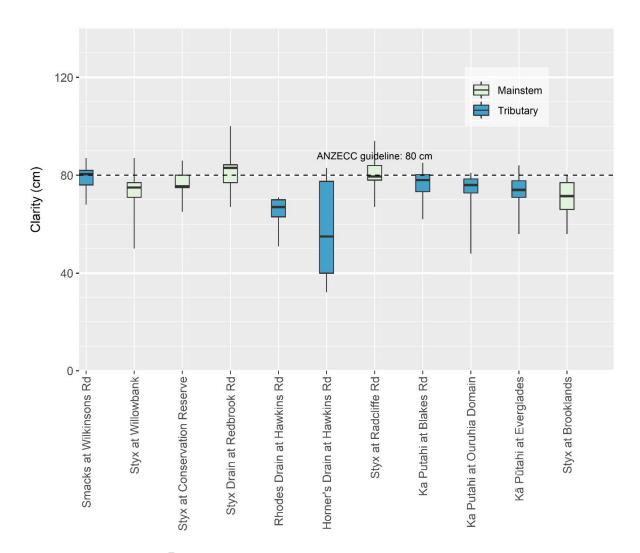

**Figure vi (b)**. Total Suspended Solid (TSS) levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the guideline value of 25 mg/L. The Laboratory Limit of Detection was 1.0 mg/L – analysed as half this value (0.5 mg/L) to allow statistics to be undertaken.

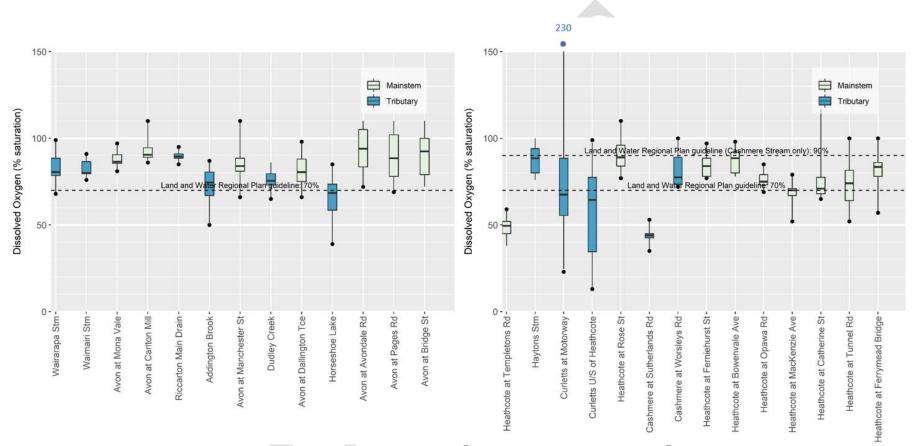

**Figure vii (a)** .Turbidity levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. The following sites were not measured for this parameter: Avon River at Carlton Mill Corner, Avon River at Avondale Road Bridge, Curletts Road Stream at Motorway, Heathcote River at Catherine Street and Heathcote River at Mackenzie Avenue. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the ANZECC (2000) guideline value of 5.6 Nephelometric Turbidity Units (NTU).

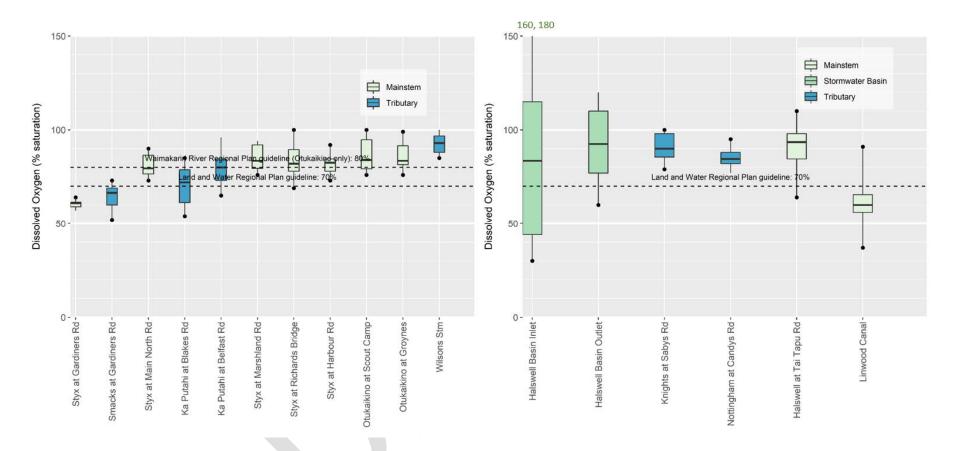

**Figure vii (b)**. Turbidity levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. The following sites were not measured for this parameter: Halswell Retention Basin Inlet and Halswell Retention Basin Outlet. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the ANZECC (2000) guideline value of 5.6 Nephelometric Turbidity Units (NTU).

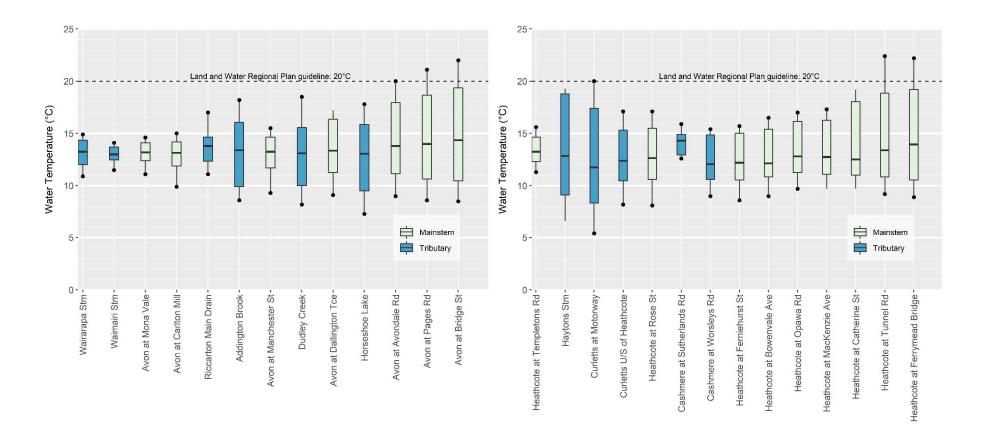

**Figure viii.** Water clarity levels in water samples taken from the Pūharakekenui/ Styx River catchment by the Styx Living Laboratory Trust volunteers for the monitoring period January to December 2019 (n = 6-10 samples per site). Sites are ordered from upstream to downstream (left to right). The dashed line represents the ANZECC (2000) guideline value of 80 cm.

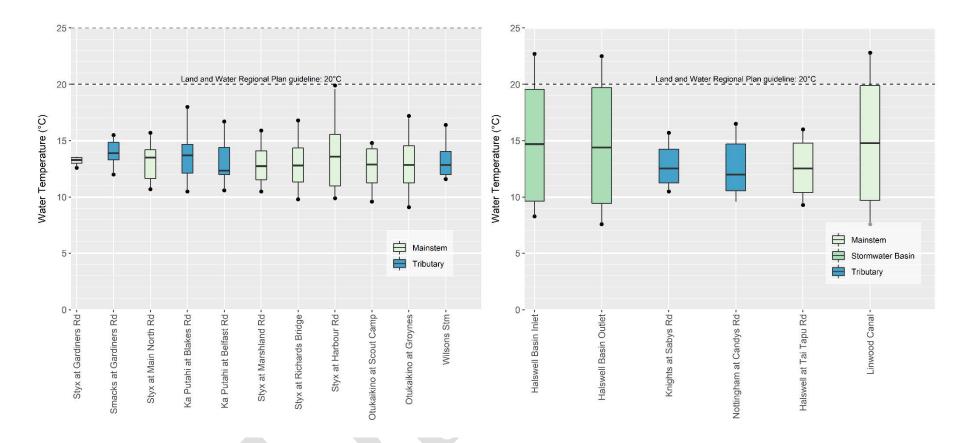

**Figure ix (a)**. Dissolved oxygen levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The lower and upper dashed lines represent the Land and Water Regional Plan minimum guideline value for 'spring-fed – plains – urban' and 'spring-fed – plains' waterways (70%), and Banks Peninsula waterways (90%; Cashmere Stream only), respectively (Environment Canterbury, 2019).

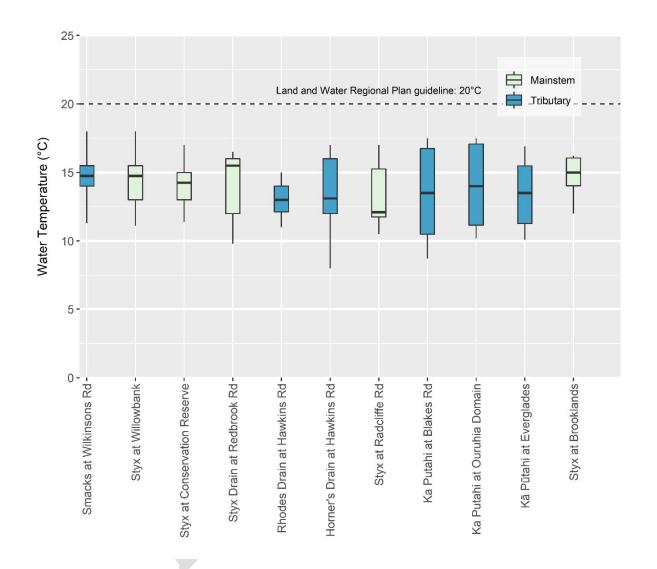

**Figure ix (b).** Dissolved oxygen levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The lower dashed line represents the Land and Water Regional Plan minimum guideline value for 'spring-fed – plains – urban' and 'spring-fed – plains' waterways (70%, Environment Canterbury, 2019). The upper dotted line represents the Waimakariri River Regional Plan minimum guideline value for all Ōtūkaikino sites (80%, Environment Canterbury, 2011).

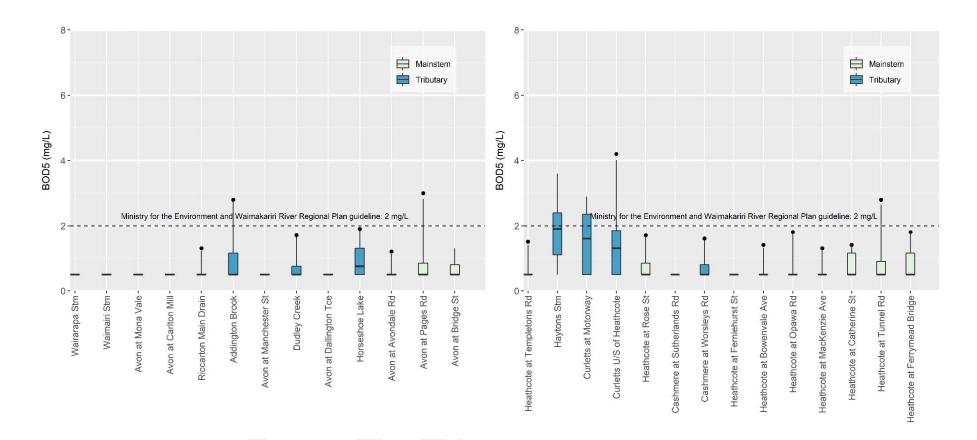

**Figure x (a)**. Temperature of the water at the time of sampling at the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed line represents the Land and Water Regional Plan maximum guideline value (20°C, Environment Canterbury, 2019).

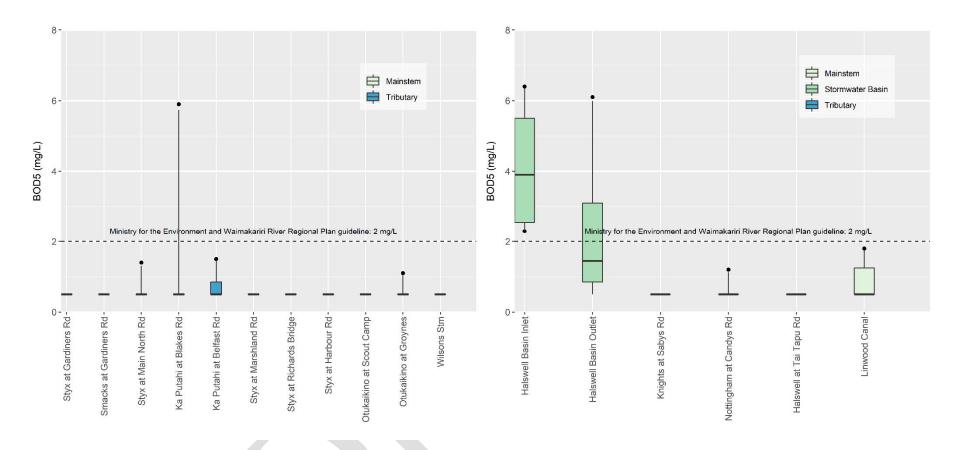

**Figure x (b)**. Temperature of the water at the time of sampling at the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan maximum guideline value (20°C, Environment Canterbury, 2019). The Waimakariri River Regional Plan maximum guideline value for all Ōtūkaikino sites is 25°C (Environment Canterbury, 2011).

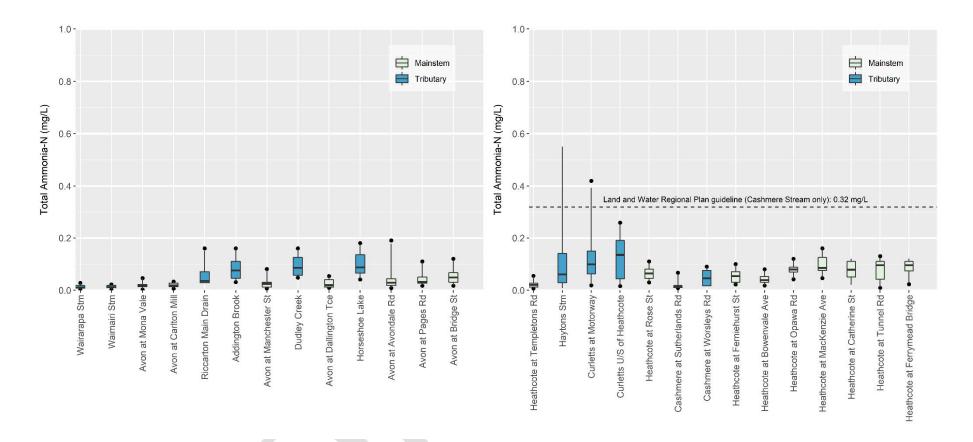

**Figure x (c)**. Temperature of the water at the time of sampling by the Styx Living Laboratory Trust volunteers for the monitoring period January to December 2019 (n = 6-10 samples per site). Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan maximum guideline value (20 °C, Environment Canterbury, 2019).

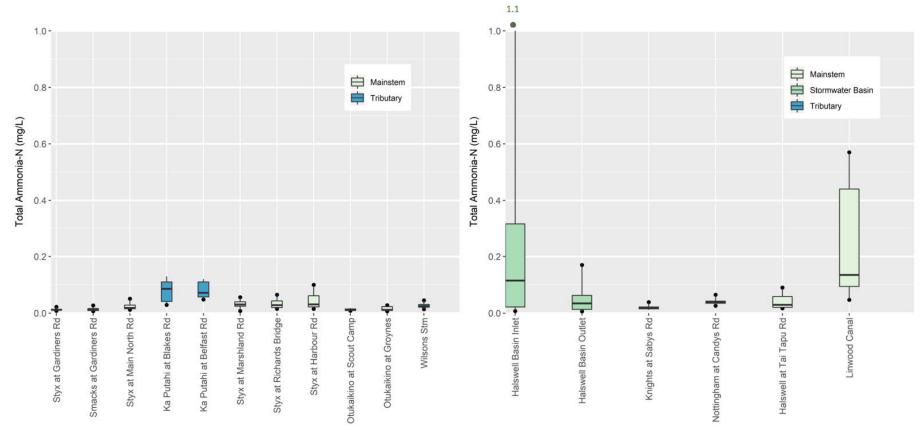

**Figure xi (a)**. Biochemical Oxygen Demand (BOD<sub>5</sub>) levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed lines represent both the Ministry for the Environment and Waimakariri River Regional Plan guideline value (2 mg/L; Ministry for the Environment, 1992; Environment Canterbury, 2011). The Laboratory Limit of Detection was 1.0 mg/L, analysed as half this value (0.5 mg/L) to allow statistics to be undertaken.

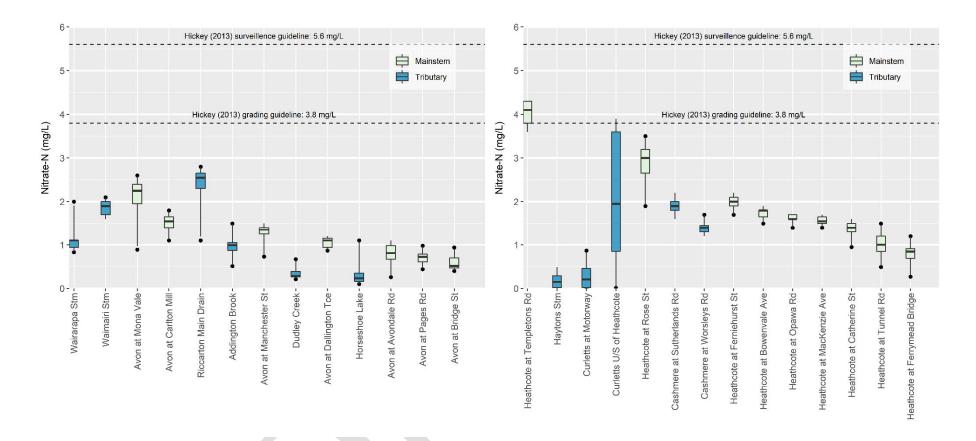

**Figure xi (b)**. Biochemical Oxygen Demand (BOD<sub>5</sub>) levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent both the Waimakariri River Regional Plan and Ministry for the Environment guideline value (2 mg/L; Ministry for the Environment, 1992; Environment Canterbury, 2011). The Laboratory Limit of Detection was 1.0 mg/L, analysed as half this value (0.5 mg/L) to allow statistics to be undertaken.

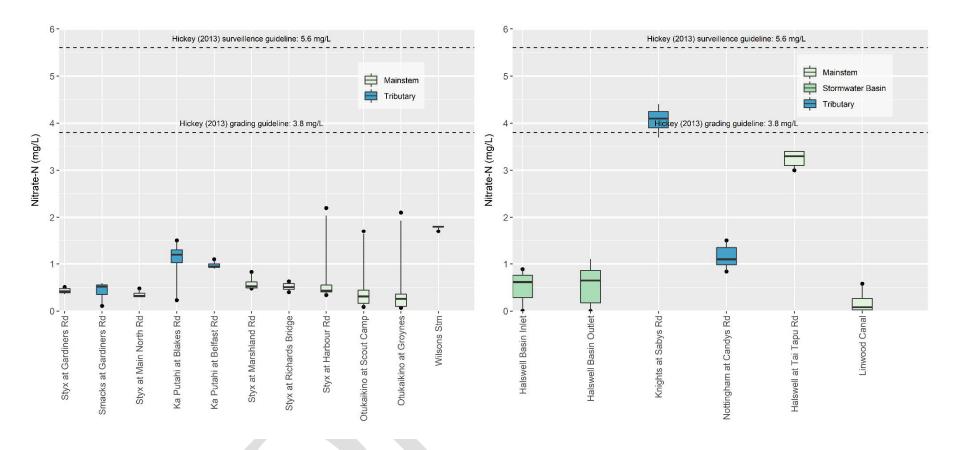

**Figure xii (a)**. Total ammonia levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The Land and Water Regional Plan guideline value (Ōtākaro/ Avon catchment: 1.88 mg/L, Ōpāwaho/ Heathcote: 1.75 mg/L,; Environment Canterbury, 2019), which has been adjusted in accordance with median pH levels for the monitoring period (Ōtākaro/ Avon catchment: 7.3, Ōpāwaho/ Heathcote catchment: 7.4), are not presented on the graph as they are off the scale. The dashed line represents the Land and Water Regional Plan maximum guideline value for Banks Peninsula waterways (0.32 mg/L, Cashmere Stream only; Environment Canterbury, 2019). The Laboratory Limit of Detection was 0.005 mg/L – analysed as half this value (0.0025 mg/L) to allow statistics to be undertaken.

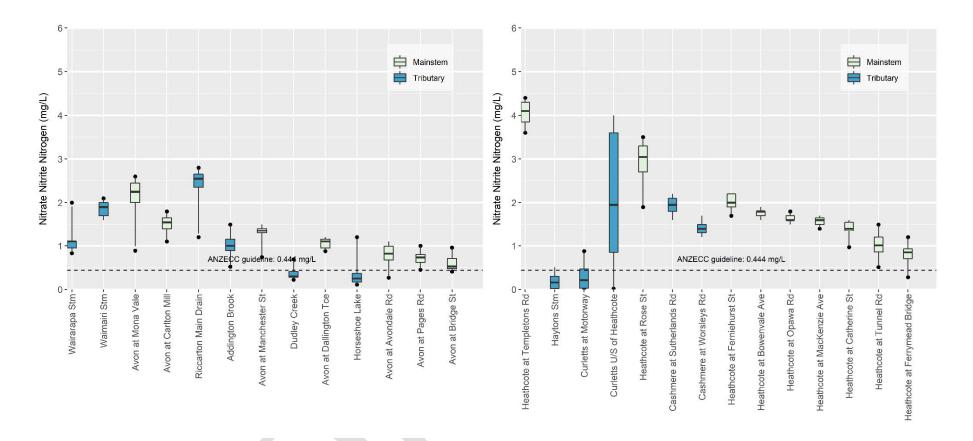

**Figure xii (b).** Total ammonia levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The Land and Water Regional Plan guideline values (Pūharakekenui/ Styx catchment: 1.99 mg/L, Ōtūkaikino catchment: 1.99 mg/L, Huritini/ Halswell catchment: 1.61 mg/L, Linwood Canal: 1.61 mg/L,; Environment Canterbury, 2019), adjusted in accordance with median pH levels for the monitoring period (Pūharakekenui/ Styx catchment: 7.2, Ōtūkaikino catchment: 7.2, Huritini/ Halswell catchment: 7.5, Linwood Canal: 7.5), are not presented on the graph as they are off the scale. The Laboratory Limit of Detection was 0.005 mg/L – analysed as half this value (0.0025 mg/L) to allow statistics to be undertaken.

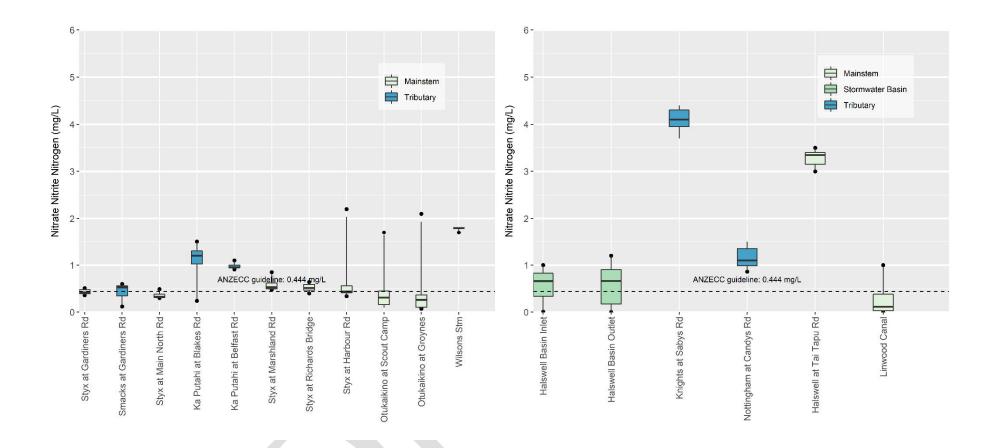

**Figure xiii (a)**. Nitrate-nitrogen levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed and solid lines represent the Hickey (2013) grading (3.8 mg/L) and surveillance (5.6 mg/L) guideline levels, respectively. The Laboratory Limit of Detection was 0.002 mg/L – analysed as half this value (0.001 mg/L) to allow statistics to be undertaken.

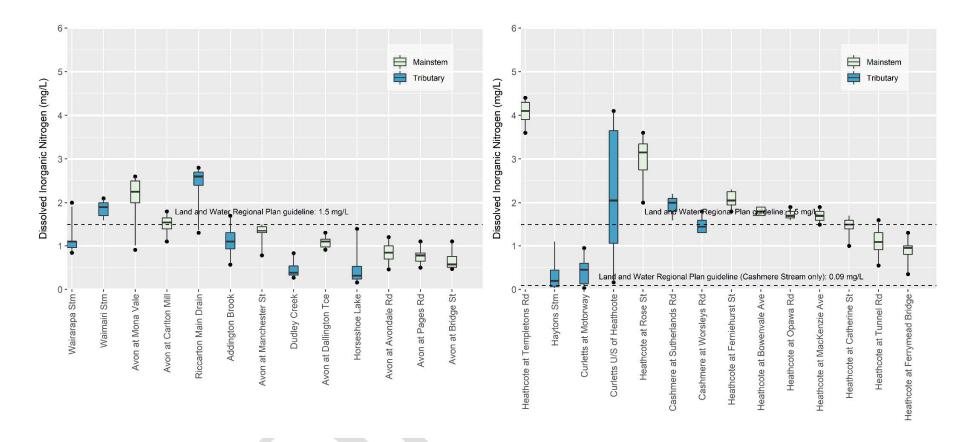

**Figure xiii (b)**. Nitrate levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino Rivers (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed and solid lines represent the Hickey (2013) grading (3.8 mg/L) and surveillance (5.6 mg/L) guideline levels, respectively. The Laboratory Limit of Detection was 0.002 mg/L – analysed as half this value (0.001 mg/L) to allow statistics to be undertaken.

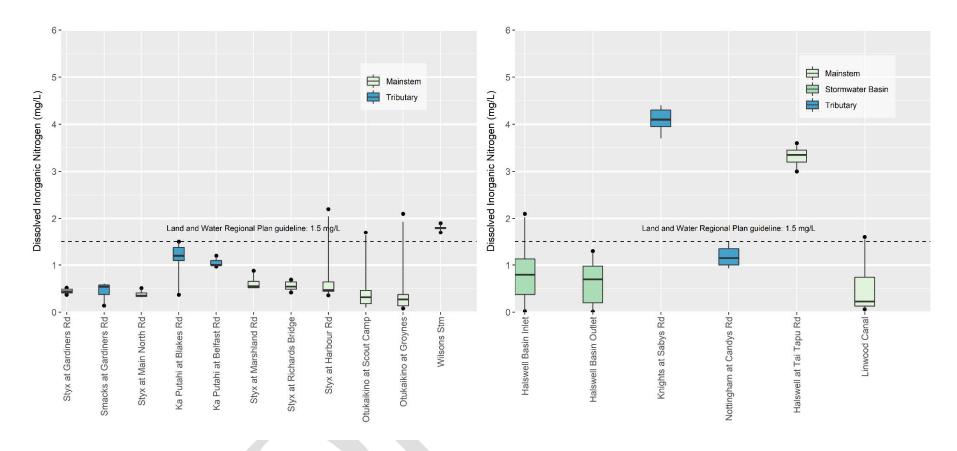

**Figure xiv (a)**. Nitrate Nitrite Nitrogen (NNN) in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the ANZECC water quality guideline (0.444 mg/L; ANZECC, 2000). The Laboratory Limit of Detection was 0.002 mg/L – analysed as half this value (0.001 mg/L) to allow statistics to be undertaken.

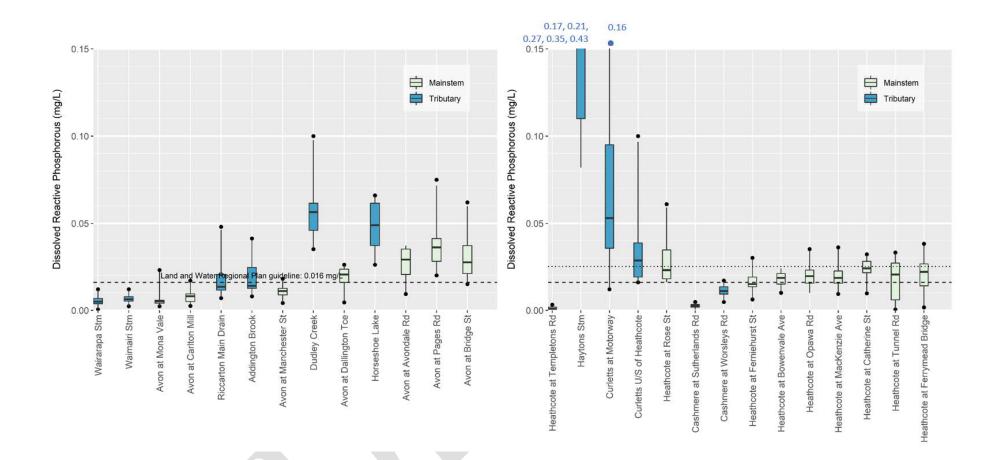

**Figure xiv (b)**. Nitrate Nitrite Nitrogen (NNN) levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the ANZECC water quality guideline (0.444 mg/L; ANZECC, 2000). The Laboratory Limit of Detection was 0.002 mg/L – analysed as half this value (0.001 mg/L) to allow statistics to be undertaken.

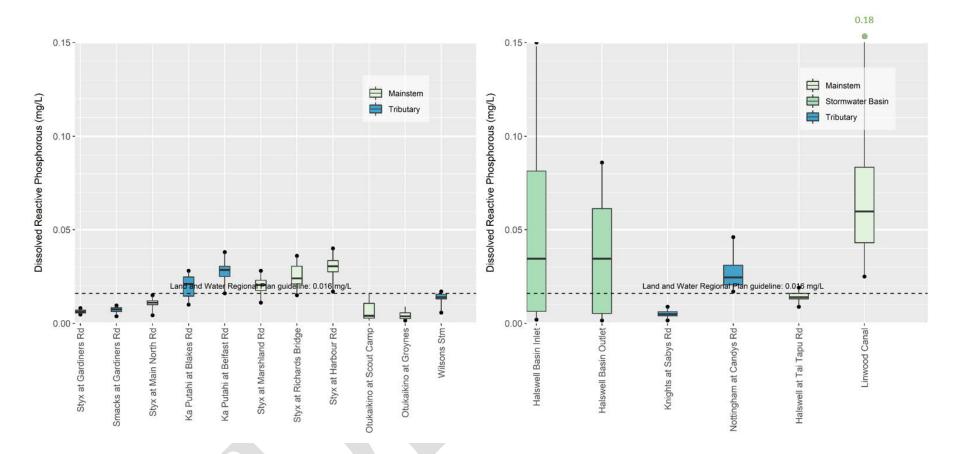

**Figure xv (a)**. Dissolved Inorganic Nitrogen (DIN) levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan guideline value of 1.5 mg/L for 'spring-fed – plains – urban' and 'spring-fed – plains' waterways, and 0.09 mg/L for Banks Peninsula waterways (Cashmere Stream only), respectively (Environment Canterbury, 2019).

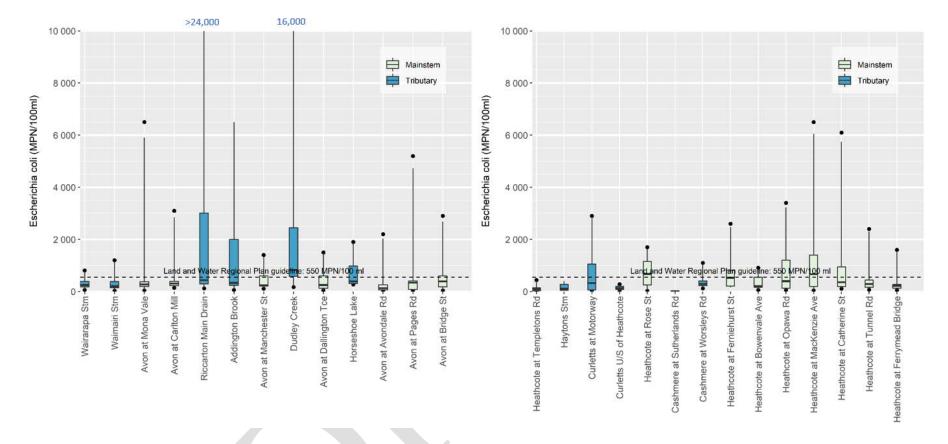

**Figure xv (b)**. Dissolved Inorganic Nitrogen (DIN) levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan guideline value for 'spring-fed – plains – urban' and 'spring-fed – plains' waterways of 1.5 mg/L (Environment Canterbury, 2019).

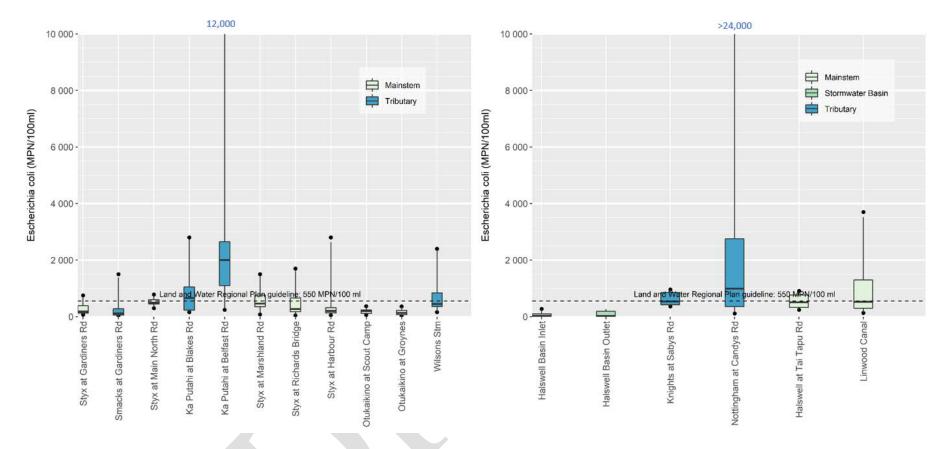

**Figure xvi (a)**. Dissolved Reactive Phosphorus (DRP) levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019. No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan guideline value of 0.016 mg/L for 'spring-fed – plains – urban' and 'spring-fed – plains' waterways, and the dotted line (right graph only), represents the Land and Water Regional Plan guideline value of 0.025 mg/L for Banks Peninsula waterways (Cashmere Stream only), (Environment Canterbury, 2019). The Laboratory Limit of Detection was 0.001 mg/L, analysed as half this value (0.0005 mg/L) to allow statistics to be undertaken.

**Figure xvi (b)**. Dissolved Reactive Phosphorus (DRP) levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan guideline value of 0.016 mg/L for 'spring-fed – plains – urban' and 'spring-fed – plains' waterways (Environment Canterbury, 2019). The Laboratory Limit of Detection was 0.001 mg/L, analysed as half this value (0.0005 mg/L) to allow statistics to be undertaken.

**Figure xvii (a)**. Escherichia coli levels in water samples taken from the Ōtākaro/ Avon (left graph) and Ōpāwaho/ Heathcote (right graph) River sites, for the monitoring period January to December 2019.No monitoring was undertaken at the Haytons Stream site in March and June as the site was dry. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan guideline value of 550 MPN/100ml for 95% of samples for 'spring-fed – plains – urban' and 'spring-fed – plains' waterways (Environment Canterbury, 2019). The Laboratory Limit of Detection varied depending on the necessary dilution of the sample, but all were analysed as half this value to allow statistics to be undertaken.

**Figure xvii (b)**. *Escherichia coli* levels in water samples taken from the Pūharakekenui/ Styx and Ōtūkaikino River (left graph), and the Huritini/ Halswell River and Linwood Canal sites (right graph) for the monitoring period January to December 2019. No monitoring was undertaken at the Kā Pūtahi Creek at Blakes Road site in August and the Ōtūkaikino Creek at Omaka Scout Camp site in February, as these sites could not be accessed. Sites are ordered from upstream to downstream (left to right). The dashed lines represent the Land and Water Regional Plan guideline value of 550 MPN/100ml for 95% of samples for 'spring-fed – plains – urban' and 'spring-fed – plains' waterways (Environment Canterbury, 2019). The Laboratory Limit of Detection varied depending on the necessary dilution of the sample, but all were analysed as half this value to allow statistics to be undertaken.
